Lexicostatistical Studies in Khoisan I: The Ju-ǀHoan Relationship¹

This paper is the first one in an intended series of publications on lexicostatistical relations between several linguistic groupings that have all been assigned by Joseph Greenberg to the hypothetical Khoisan macrofamily. Here, we examine the numbers and natures of various matches between the basic lexicon of two such groupings: the closely related cluster of Ju (North Khoisan) dialects and the Eastern ǀHoan language, formerly considered an isolate but now widely regarded as the closest, and only non-controversial, genetic relative of Ju. Based on both superficial and etymological analysis of the data (including the reconstruction of a Swadesh wordlist for Proto-Ju), we conclude that there are from 32% to 44% matches between Proto-Ju and ǀHoan (depending on the degree of strictness required from phonetic correspondences), which is translatable to a time depth comparable with such families as Fenno-Ugric and Kartvelian. Additionally, the distribution of cognates between the various stability layers of the basic lexicon is analyzed, leading to the conclusion that the matches are indeed indicative of genetic relationship rather than areal contact.

Keywords: Khoisan languages, Ju languages, Eastern ǀHoan language, lexicostatistics, glotto-chronology, comparative-historical method.

Introduction

Despite significant progress that has been achieved over the past few decades in our understanding of the linguistic nature and historical relationships of the various «Khoisan» languages², there is still very little consensus on deep level genetic connections between low-level linguistic groupings, traditionally viewed as «Khoisan». Although practically all the researchers now working in the field seem to agree that Joseph Greenberg's «Khoisan», including all the non-Bantu and non-Cushitic click languages of South and Central Africa, has not been convincingly shown to constitute a valid genetic entity, judgements differ significantly on what might be the deepest identifiable genetic links between the three commonly accepted «Khoisan» families (Northern, or Ju; Southern, or Tuu; Central, or Khoe) and the four known «Khoisan» language isolates (ǀHoan, Kwadi, Sandawe, and Hadza) — particularly because the criteria for testing the plausibility of such links often depend on the personal intuitions and preferences of researchers³.

¹ This research has been carried out as part of the Evolution of Human Languages project, supported by the Santa Fe Institute. Special gratitude goes to Dr. Bonny Sands, who provided the author with numerous insightful comments, corrections, and additional references at the early draft stage.

² For a relatively complete summary of all these developments, see Rainer Vossen's and Henry Honken's succinct overviews in Vossen (ed.) 2013: 1–24.

³ See Greenberg 1966 for a comprehensive set of arguments in favor of Khoisan as a genetic unity; Güldemann 2014 for an overview of the current state of Khoisan classification from a grammatical and typological angle. The principal conclusions («two hypotheses seem to be promising to pursue in the future. In the order of probability these would be to join Sandawe with Khoe-Kwadi, and Kx'a (= Ju-ǀHoan /G.S./) with Tuu», p. 35) are conveniently consistent with the lexicostatistical conclusions in Starostin 2013, except that I would reverse the order of the two probabilities.

A general unified framework for evaluating the various hypotheses on such links has been suggested in Starostin 2003, 2008, and further refined in Starostin 2013. It combines a formal lexicostatistical approach, serving as a common evaluation standard for all such hypotheses (applicable not only to «Khoisan» lineages but, in theory, to any of the world's language families), with elements of the traditional comparative method and Greenberg's multi-lateral comparison, and allows for a rough probabilistic ranking of competing hypotheses.

However, the framework has not really been fully applied to all relevant data. In particular, inter-group comparison in Starostin 2013 has only been conducted (a) based on the abridged 50-item, rather than the complete 100-item variant of the Swadesh wordlist; (b) based on an automated algorithm of comparison (utilising Aron Dolgopolsky's «consonant class method» of evaluating phonetic similarity⁴), rather than the more fine-grained and historically significant method of establishing recurrent patterns of phonetic correspondences. Both of these decisions were intentional and technically inevitable within the scope of a general preliminary survey, resulting in a first-approximation classification scheme that should then be subject to additional revisions and refinements.

The present paper is the first attempt at such a refinement, and is intended to provide additional insights into one of the most reliable and closest linkages confirmed by the overall survey, namely, the genetic connection between the Ju, or North Khoisan, cluster of closely related languages (or, perhaps, dialects of a single macro-language), and (Eastern) ꞤHoan (= ꞤHõã or ꞤHuã), an isolated language of Botswana. Such a connection could already be suspected from the lexical comparisons presented by Anthony Traill in his pioneering study of ꞤHoan (Traill 1973), and seemed plausible even to such a notorious «splitter» in the field of Khoisanology as E. O. J. Westphal (1974). Since then, the main proponents of a specific genetic (rather than areal) connection between Ju and ꞤHoan have been Henry Honken (1977, 1988)⁵ and George Starostin (2003, 2008)⁶. The most recent attempt for a comprehensive survey of the evidence relating the two small taxa is Heine & Honken 2010, where the authors provide their own reconstruction of the phonological system for Proto-Ju-ꞤHoan⁷, illustrating it with numerous lexical examples. All in all, the total amount of lexical and grammatical isoglosses between Ju and ꞤHoan, coupled with numerous attested phonetic regularities between the observed etymological parallels, makes the Ju-ꞤHoan relationship proposal one of the most reliable and highly probable historical hypotheses about Khoisan languages in general.

Nevertheless, in order to complete the formal testing of the hypothesis and to provide a stronger foundation for the *genetic*, rather than *areal*, interpretation of the evidence, we find it useful to present a detailed lexicostatistical evaluation of Ju-ꞤHoan, in accordance with the basic methodological guidelines laid out in Starostin 2013. A first attempt at such an evaluation

⁴ For an up-to-date description of the Dolgopolsky method, see Kassian et al. 2015: 307.

⁵ In his first publication on historical Khoisan linguistics (1977), Honken classifies ꞤHoan and Ju'hoan as «Ž1» and «Ž2» respectively, implying their close relationship without specifically commenting on it. In Honken 1988: 59, he explicitly states: «I have put Eastern Ꞥhuã firmly in the Zhu family unlike Traill who regards it as a link between Zhu and Taa», providing several examples of lexical and phonetic isoglosses to strengthen his case.

⁶ In both of these sources, the primary argument for a close relationship between Ju and ꞤHoan is made on the basis of lexicostatistical analysis. However, Starostin 2008: 356–363 also presents a first approximation for a reconstruction of the «Proto-North-ꞤHoan» phonological system.

⁷ Heine and Honken have suggested the short name «Kx'a» to denote this taxon, based on the identical phonetic shape for the word 'earth' in both Ju and ꞤHoan. This seems to be more of a mnemonic tactic than a substantial decision (why should Ju-ꞤHoan be thought of as the 'earth family'?), and it also bypasses the fact that the same word for 'earth' (kx'a) is also used in the unrelated extinct Kwadi language of Angola, which would complicate the matter even further. We prefer to stick to 'Ju-ꞤHoan' as a slightly more complex, but more accurate designation for this taxon.

was already carried out in Starostin 2003, where Proto-Ju (= Proto-North Khoisan) and ǀHoan were found to have 43% matches on the Swadesh list. However, that comparison was merely a part of a much larger general study, not allowing the author to focus on specific issues of finding and evaluating lexicostatistical and etymological matches between the two taxa; moreover, it did not properly take into account the possible effects of areal diffusion, and employed somewhat lax and properly undefined criteria for establishing phonetic correspondences. Another important limitation is that it relied too heavily on limited and not wholly accurate lexical data for ǀHoan, not being able to take into consideration a lot of data that have only been published over the past ten years (see our main sources below).

A significant improvement has been offered in Starostin 2013, which already made use of much better data for both ǀHoan and the different varieties of Ju. However, that study was also a general lexicostatistical evaluation of phonetic similarities (rather than regularities) between the different Khoisan lineages; and while the study itself, limited to the «ultra-stable» 50-item half of the Swadesh wordlist, *confirmed* the existence of a special link between Ju and ǀHoan, it did not truly *explore* that link the way a thorough joint lexicostatistical-etymological study should have done. Consequently, this paper is an attempt to remedy that situation and provide a *definitive* lexicostatistical evaluation of the evidence for Ju-ǀHoan, one that would allow us to formulate explicit historical statements about the relative chronology of these families, some particularities of their divergence, and their areal connections with other varieties of «Khoisan».

Data

Complete and most up-to-date versions of the 110-item wordlists⁸ for six different languages/dialects of the Ju group and for (Eastern) ǀHoan, accompanied by detailed annotations, are currently available at the *Global Lexicostatistical Database* (<http://starling.rinet.ru/new100>). The Ju lists differ significantly in quality, since only two of them are drawn from relatively recent sources that benefit from greater phonetic and semantic accuracy⁹: Ju'hoan, based on Patrick Dickens' dictionary (Dickens 1994), and Northwestern (Ekoka) !Xun (!Xung), based on the glossary in König & Heine 2008 (and largely coinciding, pending certain phonetic discrepancies, with the data in Heikkinen 1986).

The availability of both these sources today is a strong advantage, since Ju'hoan and Ekoka represent two different sub-clusters of Ju dialects and are about as far removed from each other lexically as any two languages/dialects of Ju can be. However, for the sake of etymological and lexicostatistical accuracy, and as a necessary condition for a reliable reconstruction of the basic lexicon for Proto-Ju, it is imperative to also make use of older data, namely, the vocabularies collected by Lucy Lloyd, Dorothea Bleek, and Clement Doke, all of them eventually integrated in D. Bleek's monumental comparative dictionary (Bleek 1956). We have specifically selected four varieties:

⁸ The 110-item wordlist is a slightly expanded version of the standard 100-item Swadesh wordlist (with 10 additional items from the earlier 200-item version) commonly used in lexicostatistical studies conducted by the Moscow school of comparative linguistics. For specific details on the semantics of individual items and on the handling of potential synonyms, see Kassian et al. 2010.

⁹ This should not be understood as implying that these works are completely free of phonetic errors: in most cases, it makes sense to compare transcriptions by different specialists where they are available. Nevertheless, qualitative differences between most of the modern sources look relatively negligible when compared with the first systematic attempts at transcribing Ju (and other Khoisan) phonologies in the early 20th century.

(a) Lucy Lloyd's «!Kung», recorded in 1879–1880 from four young informants from around lake Ngami; typically correlated with what has been termed the «Central Dialect Cluster» in Snyman 1997, Treis 1998, and Sands 2010, but more recently re-aligned with the «North-Central» cluster by Florian Lionnet (2009) because of specific lexical, phonetic, and grammatical isoglosses;

(b) Clement Doke's «!Hũ» of Grootfontein (research originally published as Doke 1925), also typically grouped in the Central cluster (despite some significant discrepancies with Lloyd's data, although it is often hard to understand if these discrepancies are real or due to inaccurate fixation);

(c) Dorothea Bleek's «!K'au||en» or «!Au kwe» (the most modern transcription in Vossen 2013: 9 puts the dialect's name as ʰx'áo-||'àèh), recorded in the early 1920s at Sandfontein; this dialect is typically assumed to belong to the Southern cluster as well (Treis 1998: 468), although the issue remains open due to lack of modern data from the same region (Sands 2010)¹⁰;

(d) Dorothea Bleek's «!O!kung», recorded in Central Angola in 1925; this dialect is lexically and phonetically very close to Ekoka !Xun, as well as to «Angolan !Xũ», a brief account of which was published as Snyman 1980.

All four of these sources share the same advantages (sufficient in size to allow for a relatively complete and representative set of Swadesh-type wordlists; recorded a hundred or so years ago in communities slightly less linguistically susceptible to Khoe, Bantu, and European influence than they are today) and flaws (generally poor quality of transcription and possible semantic inaccuracies). In the case of this particular study, however, phonetic inaccuracies are not a significant problem as long as the necessary adjustments are made (i.e. there is a general understanding of what kinds of errors are typical for Lloyd's and Bleek's data); semantic inaccuracies are far more harmful for lexicostatistical data and can severely influence classifications and datings, but as long as the data may be compared with data from more recent and accurate sources, most of the potential errors may be successfully filtered out on the way from modern data to the reconstructed proto-wordlist¹¹.

No «official» dictionary has so far been published for Eastern ʰHoan, but enough lexical data have become available in the past few decades to make the language perfectly acceptable for lexicostatistical comparison. Most of that data have been collected by Jeffrey Gruber (G) and Chris Collins (C), our main source being the relatively recently published comparative grammar of the language (Collins, Gruber 2014), well illustrated by lexical and textual examples, and also heavily drawing upon previously published papers by the same authors (Collins 2001, 2002; Bell, Collins 2001; Gruber 1975). A few lacunae had to be filled in by data from the first ever published wordlist of ʰHoan that was put together by Anthony Traill (1973); overall comparison of Traill's data with Gruber's and Collins' materials shows that, while the quality of Traill's transcription leaves a lot to be desired, his elicitation of ʰHoan lexical equivalents for basic semantic notions was largely correct.

Naturally, some data sources for other Khoisan languages have to be taken into consideration as well, since any serious study on the etymology or lexicostatistics of Ju-ʰHoan has to take the areal factor into account. In particular, ʰHoan is known to have been in tight contact

¹⁰ Work on the documentation of ʰx'áo-||'àèh is currently being conducted by Lee Pratchett (2017), but outside of several papers dealing with specific phonetic and grammatical issues, no comprehensive data collections have yet been made publicly available.

¹¹ For the basic principles of reconstructing an «optimal» Swadesh-type proto-wordlist from attested lexical data (in accordance with which we reconstruct the Proto-Ju wordlist in this paper), see Starostin 2016.

with |Gui, a Kalahari Khoe language, and through it (and, perhaps, directly as well), also with !Xóǀ, a Taa language (Traill & Nakagawa 2000); although some of the resemblances between ǀHoan and !Xóǀ are not to be ruled out as potential evidence for genetic relationship on a deeper level than Ju-ǀHoan (Starostin's «Peripheral Khoisan»), specific binary isoglosses between the two languages without any parallels in the rest of «Peripheral Khoisan» are most likely explainable as results of diffusion. Most of the references to !Xóǀ lexicon will be given according to Traill 1994; Kalahari Khoe references will be provided according to the reconstructions in Vossen 1997, except where specially noted.

For the sakes of general convenience, we utilize here a unified system of transcription as is currently adopted for the purposes of the *Global Lexicostatistical Database* project; for the most part, it does not differ from IPA, except for a few details (such as the use of single-graph vs. digraph transcriptions for affricates: IPA $ts = c$, IPA $tʃ = č$, IPA $tɕ = ɕ$, etc.). In our transcription of click accompaniments, we also follow the old transcriptional convention by Rainer Vossen (1997), where voiced clicks are transcribed as $ɓ$, $ɗ$ etc. (instead of g , $gʔ$ or g , $ʔg$, etc.) and nasalized are transcribed as $ɓ̃$, $ɗ̃$ etc. (instead of n , $nʔ$ or n , $ʔn$ etc.).

Comparative procedure

For the sake of historical accuracy, lexicostatistical comparison between Ju languages and ǀHoan has to be carried out on the level of protolanguage reconstruction in the case of Ju¹². Although some details of Proto-Ju and the phonetic laws that tie it to its modern descendants still remain poorly understood (mostly in the sphere of tonology and non-productive/fossilized nominal morphology), all the dialects are close enough to provide evidence for the basic phonetic shape of the protoforms, particularly with the aid of precious comparative data in J. Snyman's (1997) dialectal survey. It is very important not to rely exclusively on a single source, such as Patrick Dickens' exhaustive dictionary of Jul'hoan, which, paradoxically, sometimes provides *too much* data for an accurate lexicostatistical analysis (for instance, many basic terms, such as body parts, are often represented in that dictionary by doublet forms — one inherited from Proto-Ju, one recently borrowed from Khoe; external comparison with other Ju dialects helps sort the situation out very easily).

Although a definitive areal/historical classification for Ju dialects is still lacking, it seems clear from both phonetic and lexical evidence that the sharpest dividing line separates the Southern cluster, represented most prominently by Jul'hoan, from the Northern cluster, represented by Ekoka !Xun. The lexicostatistical implications are such that, quite often, one finds a binary opposition between Jul'hoan (and related dialects) and Ekoka (and related dialects), where simple distributional considerations are not enough to understand which of the two roots is a better candidate for the respective «Swadesh meaning» on the Proto-Ju wordlist. In such cases, we resort to «extra-distributional rules»¹³ to help resolve the situation, wherever they are applicable. When no reasonable choice can be made, we may count two roots as «technical synonyms» and subject both of them to comparison with ǀHoan.

¹² Theoretically, it is also possible to subject ǀHoan data to the reconstruction procedure, since we know of at least one additional dialectal variety, Sasi, somewhat divergent from ǀHoan proper; however, data on Sasi are extremely limited and, at best, show it to be slightly more archaic in terms of certain phonetic features, but not in terms of lexical stability. For more details on the differences between the two dialects, see Collins & Gruber 2014: 17–20.

¹³ For a complete list of said rules, illustrated by examples, see Starostin 2016. These typically have to do with internal etymologization or external analysis (checking for borrowings, etc.).

Matches between Proto-Ju reconstructions and ꞤHoan forms are evaluated on a somewhat fine-grained scale, allowing for a more insightful final analysis. The «evaluation marks» are as follows:

+ : *Definitive lexicostatistical matches*. To get a + mark, both parts of the comparison have to be reliably attested or reconstructed in the appropriate Swadesh meaning, *and* be phonetically compatible, i.e. agree with the basic correspondence patterns, identified in Starostin 2008 and in Heine & Honken 2010 (see below on the comparison between the two systems). «Phonetic compatibility» does not necessarily imply complete historical transparency of the correspondences between each of the segmental and suprasegmental features, but it does imply that the majority of segmental alignments should display pattern-like behavior¹⁴.

± : *Potential lexicostatistical matches*. These pairings, also reliably attested or reconstructed in the appropriate Swadesh meaning, typically display a remarkable degree of phonetic similarity, but also feature at least one (preferably not more than one) major segmental discrepancy that cannot be explained according to our current understanding of the historical phonology of Ju-ꞤHoan. Such matches cannot be taken as direct evidence for relationship and should not be included into the main round of lexicostatistical calculations, but since we cannot claim to know everything there is to know about regular vs. sporadic developments from Proto-Ju-ꞤHoan to their modern descendants, it makes perfect sense to make note of such potential matches and include them in an alternate set of lexicostatistical calculations (see below).

≈ : *Etymostatistical (etymological) matches*. Since this study is carried out on the data of a compact, binary taxon, tied together by sets of phonetic correspondences, it makes sense to expand the strict lexicostatistical analysis (demanding exact semantic matches between compared items) by also taking into consideration those situations where a Proto-Ju Swadesh item finds a good phonetic/semantic match in ꞤHoan (or vice versa), but the meanings are semantically related rather than semantically identical. Based on typological (and simply logical) arguments, in any situation of language relationship we should be able to find such matches in addition to direct lexicostatistical ones, and comparing their numbers and their character to those of direct lexicostatistical matches should provide additional insight into the degree and nature of their relationship.

- : *No matches*. There are no hitherto detected parallels between the compared items. (Given the deficiency of our knowledge on Ju and especially ꞤHoan lexicon, any of these pairings could turn out to be etymostatistical matches in the future, but it is highly unlikely that they will ever turn out to be direct lexicostatistical matches).

? : *Insufficient data*. These are the cases where the respective item is not attested in our sources on ꞤHoan (e.g. ‘bark’), or is insufficiently well attested in Ju idioms to be reconstructible (e.g. ‘round’). In all such cases, the Swadesh item is excluded from calculations, and any percentages are calculated out of the remaining items. The same also applies to a few cases where either the ꞤHoan item (e.g. ‘salt’) or the Proto-Ju (or, rather, «Common Ju») item (e.g. ‘fish’) is highly likely to have been borrowed from a third source, such as !Xóõ or Khoe.

An additional factor to be taken into consideration is the distribution of detected cognates across the wordlist. In accordance with the well-known and empirically well confirmed «Yakhontov principle» (genetically related languages will share more matches on the more stable sub-

¹⁴ For instance, the exact factors determining the lack or presence of voicing during click articulation in Ju-ꞤHoan cognates remain obscure; however, recurrent examples are available for all four types of possible correlations, confirming their regularity. In other words, it is impossible at present to offer unequivocal Proto-Ju-ꞤHoan reconstructions for such items (due to insufficient data or incomplete analysis of all the factors that could be involved), but it is possible to regard them as reliable cognates.

section of the lexicostatistical wordlist, while languages in contact will share more matches on the less stable sub-section), we separate the 100-item list in two halves and compare the numbers for all types of matches (definitive, potential, etymostatistical) separately, so that the nature of relationship between Ju and ǀHoan could be assessed according to that parameter — and so that the results could also contribute to establishing a general benchmark for all such types of situations.

Correspondences

Unlike deeper level lexicostatistical comparisons, where comparanda still have to be evaluated on the basis of phonetic similarity rather than phonetic correspondences, Proto-Ju and ǀHoan forms have the benefit of actually being linked together by recurrent phonetic isomorphisms, as shown in Starostin 2008 and Heine & Honken 2010. Due to data limitations and certain unresolved issues with Proto-Ju itself, these isomorphisms have not yet been processed to the stage of a definitive, all-encompassing phonological reconstruction of Proto-Ju-ǀHoan, but enough of them have been observed for us to be able to confidently propose common Ju-ǀHoan etymologies even in certain cases where the forms do not at all look alike.

In the notes section for each individual comparison, we typically comment on the degree of regularity that may be inferred for specific Ju-ǀHoan segments, particularly when these segments are not phonetically identical. Where necessary and/or possible, additional examples to confirm the recurrent nature of the pattern are drawn upon from the available corpus of Ju-ǀHoan etymological comparanda (most of it published either in Starostin 2008 or in Heine & Honken 2010). The complete list of correspondences observed between Ju and ǀHoan basic lexicon items is given in the Appendix, with each correspondence enumerated so that it can be briefly referred to in the main section of the paper.

A detailed description of the phonological systems of (Proto-)Ju and ǀHoan lies well beyond the scope of the current paper. See Miller 2013 for an up-to-date brief account of Ju phonology and phonetics, Honken 2013 for the same concerning Eastern ǀHoan, and the above-mentioned papers by Starostin and Heine/Honken for comparisons between the two.

Abbreviations

Language names: PJ = Proto-Ju; Ek. = Ekoka !Xun; Ju. = Ju'hoan; Kg. = (Lucy Lloyd's) !Kung; Kx. = ǀX'áo-ǁ'ǎè; OK. = (Dorothea Bleek's) !O!Kung.

Sources: C = Ch. Collins (for ǀHoan); G = J. Gruber (for ǀHoan); S = B. Sands (for ǀHoan); HH = Heine, Honken 2010; SH = Sands, Honken 2014.

Ju/ǀHoan comparative wordlist

1. ALL (+)

- PJ: ***wòe-še** (Ju. *wè-šè*, Kx. *oá-sí*, Gr. *we:še-sñ*, OK. *wì-sè ~ wè-šè*, Ek. *wòhē-šē*). ◇ Preserved in all daughter dialects. No alternate stems. The reconstruction follows the Ekoka variant as phonetically more archaic in its vocalism; the variant **wè-še* is also possible. Extra low tone in Ekoka is not, however, confirmed by the rest of the data. The form is morphologically complex: the derivation is transparently seen in Ekoka, cf. *wòhà* 'for-

ever', *wðhè* 'some time ago, already, just'. The meaning of the suffix **-še*, however, remains unknown.

- †Hoan: *ùē* (G).
- Ju-†Hoan: A phonetically similar and compatible match¹⁵. Since initial **w-* in PJ is not prothetic, we have to suppose simplification in †Hoan (**woe* → *ue*). The suffix **-še* may have been a PJ innovation. ◇ HH: 14.

2. ASHES (-)

- PJ: **tō̃* (Ju. *tō̃*, Kx. *tɔ̃*, Kg. *tɔ̃* ~ *tó*). ◇ Not attested in the Nothern dialects, except for the reduplicated variant *tāõ-tāõ* in Snyman 1980: 33. OK. *ḑā* 'ashes' = Ju. *ḑā̃* 'soap', both forms probably having been borrowed from Khoe sources, cf. Proto-Khoe **ḑoa* 'ashes' (Vossen 1997: 417); Ek. *ḑhà* 'ashes' probably belongs here as well, but the click correspondence is irregular (possibly a transcription error).
- †Hoan: *ḑoe* (T). ◇ Only attested in Traill's records (as *ḑoe* ~ *ḑue* ~ *ḑueʰ*), so the precise phonological shape is uncertain; however, the word is clearly not a possible match for PJ.
- Ju-†Hoan: No lexicostatistical or etymological matches.

3. BARK (?)

- PJ: **ḑʰrV_A* (Ju. *ḑʰròrò*, Ek. *ḑʰlì*). ◇ Reliably reconstructible for the PJ stage, although in many dialects, particularly those found in Bleek's dictionary, the meaning 'bark' is usually merged with 'skin' (Kx. *ḑo-si*, Kg. *ḑ̃* ~ *ḑ̃* ~ *ḑwa*; see 'skin' below).
- †Hoan: Not attested.

4. BELLY (+)

- PJ: **ḑú* (Ju. *ḑú*, Kx. *ḑú*, Kg. *ḑù* ~ *ḑú*, Gr. *ḑú*, OK. *ḑú*, Ek. *ḑú*). ◇ Preserved in all daughter dialects. No alternate stems. Straightforward reconstruction.
- †Hoan: *ḑō* (C, G); *ḑúṽ* ~ *ḑōṽ* ~ *ḑúṽ* (S).
- Ju-†Hoan: A phonetically similar and compatible match (see corr. #12, #38a). ◇ HH: 17¹⁶.

5. BIG (≈)

- PJ: **ḑʰàʔà* (Ju. *ḑʰàʔà*, Kx. *ḑʰa:/*, Kg. *ḑʰa*, Gr. *ḑʰʔa*, OK. *ḑʰa* ~ *ḑʰá* ~ *ḑʰaa*, Ek. *ḑʰà* ~ *ḑʰàʔà*). ◇ Preserved in all daughter dialects. Correspondences are regular, indicating an original retroflex nasalized click and a glottal stop between the vowels.
- †Hoan: (a) *ḑʰĩ*, (b) *ḑʰāo* (C, G). ◇ Both of these words are consistently glossed as 'big' in available sources, but textual examples offer no hint at their semantic differences.
- Ju-†Hoan: No direct matches. However, (a) is a transparent etymological match with PJ **ḑʰi* 'much, many' (Ju. *ḑʰái*, OK. *ḑʰí*, etc.; see MANY); the semantic shift 'big' ↔ 'many' is quite trivial, although the direction of the shift remains unclear in this case.

¹⁵ The vocalic correspondence is unique (if we are talking about the coda as a whole), but there are not a lot of cases of Proto-Ju **-oe* with reliable parallels in †Hoan. At least one attested case also involves †Hoan *-ui* (PJ **šoe* 'to take out / take off' = †Hoan *šui* 'to drop off').

¹⁶ In Sands, Honken 2014: 252, the connection is put in doubt because of the incompatibility of Ju *ḑ-* and †Hoan *ḑʰ-*, but it is not certain that the aspirated accompaniment is phonologically primary in this case (most of the other sources agree on zero accompaniment, and even Sands herself records phonetic variation between *ḑ-* and *ḑʰ-*).

6. BIRD (-)

- PJ: ***c̣ā(m)-mà** (Ju. *c̣àmà*, Kx. *cama*, Kg. *caba*, Gr. *c̣auà*, OK. *cama*, Ek. *čámà*). ◇ Preserved in all daughter dialects. The word is morphologically complex; the second component is clearly identifiable as PJ *-*ma* ‘small; diminutive suffix’, cf. the corresponding plural form *čá-m̃^hè* in Ek. Given the additional presence of Ek. *čám* ‘poultry, bird, aeroplane’, it is possible, but not certain, that the original root shape was **c̣ām* rather than **c̣ā* (with subsequent contraction *-*mm-* → *-*m-* in most dialects).
- ǀHoan: **ǁĩ-sì**: (G). ◇ The suffix -*si* is a diminutive morpheme.
- Ju-ǀHoan: H. Honken (1988: 60) quotes the ǀHoan form *c̣ḥà:ma* ‘bird’, apparently taken from Gruber’s formally unpublished field records; if it really exists and has an ornithological meaning, it is clearly related to the PJ equivalent. However, no additional sources confirm this, and all text examples that can be elicited from existing sources clearly show that *ǁĩ-sì* is the most common and neutral generic term for ‘bird’ in this language. Pending further publications of data, we prefer to disregard this form for the time being.

7. BITE (±)

- PJ: ***ǁāē** (Ju. *ǁái*, Kx. *ǁā ~ ǁe(:)*, Kg. *ǁē: ~ ǁē:*, Ek. *ǁāē-m̃*). ◇ The only divergent form is OK. *ǁā*, unless Bleek’s transcription of the dental click is erroneous (not highly likely). The Ek. form (a compound with *m̃* ‘eat’ as the second part) is essential for the reconstruction, since this is the only dialect in which the preglottalized nasalized click has been explicitly elicited. Vocalic correspondences point to the diphthong **ae* rather than **ai* as the original constituent.
- ǀHoan: **ǁái** (C).
- Ju-ǀHoan: Despite obvious phonetic similarity (click influx and vocalism match perfectly), the two forms cannot be considered a solid etymological match, since the preglottalized nasal click in PJ always corresponds to a nasal click in ǀHoan as well (see HEAD below). Nevertheless, with two features matching out of three, the unique correspondence between click effluxes may reflect some undetected contamination, or even be part of a regular pattern, undetectable due to lack of data. We count this as a potential match with low probability.

8. BLACK (-)

- PJ: ***ǁō** (Ju. *ǁó*, Kx. *ǁǃ*, Kg. *ǁǃ ~ ǁò ~ ǁǃ*, OK. *ǁó ~ ǁu:*, Ek. *ǁǃ*).
- ǀHoan: **ǁkxau** (C).
- Ju-ǀHoan: No lexicostatistical or clearly defined etymological parallels.

9. BLOOD (+)

- PJ: ***ǁVŋ** (Ju. *ǁán*, Kx. *ǁĩ*, Kg. *ǁĩ ~ ǁĩŋ*). ◇ Vocalic reconstruction is uncertain. This word is not attested in the Northern cluster, where the corresponding equivalents fluctuate between **ǁō^rru* (Ek. *ǁǃ^rlú ~ ǁǃ^rlú*; cf. also Kg. *ǁǃ^rru ~ ǁǃ^rru*) and **yaru* (OK. *yalo ~ yalu*, quoted as *yàlò ~ yúlà* in Snyman 1980: 34). The former of these is probably inherited, but its dialectal distribution is quite sparse compared to **ǁan*; the latter has a phonetic shape that is highly atypical of Ju languages (with an initial *y-*) and is most likely of non-Ju origin.
- ǀHoan: **ǁqí** (C), **ǁí**: (S).
- Ju-ǀHoan: A plausible lexicostatistical match with recurrent phonetic correspondences. ◇ SH: 238.

10. BONE (-)

- PJ: **!ú* (Ju. *!ú*, Kx. *!ú*; Kg. *!ù ~ !ú*, Gr. *!ú*; OK. *!u ~ !o*, Ek. *!ú*). ◇ Preserved in all daughter dialects. Ju. shows the rare extra high tone on this root, possibly an archaic feature.
- †Hoan: *ǃáˀ* (C) ← **táˀ*. ◇ Internal phonetic reconstruction derives all palatal plosives from original coronal stops.
- Ju-†Hoan: No lexicostatistical matches; the closest etymological connection to PJ **!ú* in †Hoan may be *!ui* ‘spine’ (C), but only provided that final *-i* can be explained away as an old suffixal extension, which is currently unclear. The †Hoan word has no known Ju equivalents. ◇ In HH: 15, the comparison of PJ **!ú* to †Hoan *!ui* is justified by reconstructing an obscure diphthong **-Vi* (cf. PJ **!xo* = †Hoan *!xú* ‘elephant’ for extra support), but this is not a phonologically viable explanation; it is more likely that morphological reasons are responsible for both cases.

11. BREAST (= CHEST /male/) (-)

- PJ: **!òǃá* (Ju. *!òǃá*, Kx. *!wa*). ◇ The reconstruction is approximate due to lack of data (initial click could have been **ʄ* instead of **ǃ*). Essentially an isogloss between Ju. and Kx.; a much less stable root than the far more widespread and perfectly reconstructible **ku* ‘female breast; milk’ (→ Ju. *kù*, Ek. *kūú* etc.). Nevertheless, the only alternate candidate for PJ ‘/male/ chest’ is Ek. *čōǃā*, corresponding to various forms with the meaning ‘lungs’ in Ju dialects (Gr. *sūǃā*, Cuito/Cuando *šōǃā*, etc.) and probably representing the results of a metonymic semantic shift.
- †Hoan: *!ǃǃˀmā* (C, G). ◇ The meaning of this word is glossed as ‘chest (of humans)’ in Collins 2001: 458; according to the same source, this item is lexically opposed to *!oǃe* ‘chest (of animal)’ and *ǃxū* ‘breast (of a non-human animal)’.
- Ju-†Hoan: No lexicostatistical matches, although, interestingly enough, both words have parallels in Taa — †Hoan *!ǃǃˀmā* is practically the same item as *!Xóǃ !ǃǃˀma* ‘sternum’ (the parallel may reflect either a genetic or an areal connection), while PJ **!òǃá* is formally comparable with *!Xóǃ !ú* ‘chest’).

12. BURN (tr.) (?)

- PJ: **!kūú* (Ju. *kùǃú*, Kx. *kou ~ kau*, Kg. *kuú ~ kóú ~ kóú*, Ek. *kūǃú*). ◇ Preserved in all daughter dialects, often with polysemy ‘to burn / to roast’.
- †Hoan: Not attested in reliable sources. Traill (1973: 29) quotes two different forms, *θui* and *ǃam*, both with the meaning ‘burn’. He does not specify, however, whether these stems are transitive or intransitive, and their existence has not yet been confirmed in published sources.

13. CLAW (= NAIL) (±)

- PJ: **!ǃǃúǃú* (Ju. *!ǃǃúǃú*, Kx. *ǃǃuru*, Kg. *ǃǃuru*, Gr. *ǃǃǃú*, OK. *ǃǃulu ~ ǃǃonu*, Ek. *ǃǃúǃú*). ◇ Preserved everywhere. Reliably reconstructed with a retroflex click, although the Ek. reflex *!-* instead of *ǃ-* is irregular; it may reflect a secondary contamination with **!uru* ‘quiver’ (= Ju. *!ǃǃú*, etc.). Glottalic articulation in word-medial position is less certain (only attested in Ju.).
- †Hoan: *!ǃˀ* (HH), *!ǃˀo* (C).
- Ju-†Hoan: The potential relation between these two forms is problematic. The correspondence between Ju **!ǃ* and †Hoan *!* is supported by at least two more significant examples (PJ **!ǃǃma* ‘to enter’ — †Hoan *!ǃˀm* ‘to enter /plural action/’; PJ **!ǃai* ‘puff-adder’ —

ODD (?)

- PJ: Not properly reconstructible. The best candidate is probably the PJ compound ex-

- PJ: *ʔàʔū (Ju. ʔàʔú, Kg. ʔáo ~ ʔáoʔ, Ek. ʔàʔ ~ ʔàʔō). ◇ In the Southern cluster, this equivalent

- PJ: ***ci** (Ju. *cí*, Kx. *cí* ~ *čí*, OK. *cí* ~ *čí*). ◇ In many dialects, this meaning corresponds to

17. DIE (+)

- PJ: ***!ae** (Ju. *!áí*, Kx. *ǃé: ~ ǃéi ~ ǃí*, Kg. *ǃé ~ ǃè*, Gr. *!áí*, OK. *ǃé ~ ǃe*, Ek. *ǃāē ~ ǃē*). ◇ Preserved in all daughter dialects. Singular subject action verb; the corresponding plural form is ***!ao** (Ju. *!àò*, Kx. *ǃau*, Kg. *ǃau*, OK. *ǃau*, Ek. *ǃāō*). Both stems are reliably reconstructed with the retroflex click, and it is tempting to trace them back to a single root (***!a-**) with different vocalic extensions. However, there is not a single other example that could hint at the productivity of this morphological operation on the PJ level; considering that all other known pairs of singular vs. plural action verbs in PJ are completely suppletive, etymological relationship between ***!ae** and ***!ao** cannot be reliably demonstrated without supporting external data.
- ǃHoan: **ǃǐ** (G, C). ◇ The plural action equivalent is a composite form: *ǃǐ-ǃā*.
- Ju-ǃHoan: The correspondence between the PJ voiced/voiceless retroflex click and the ǃHoan voiced/voiceless palatal fricative is recurrent (see more examples in the entries for ‘hand’, ‘water’, corr. #35b); vocalic correspondences are also easily reconciled, and cases where sporadic nasalization in ǃHoan is missing in Ju. are well known (cf. PJ ***!a** ‘to stand /plural action/’ = ǃHoan *ǃā* id., corr. #18). This is a sufficient basis to regard both forms as etymological and lexicostatistical matches. However, the singular/plural action suppletivism of Ju finds no parallels in ǃHoan.

18. DOG (-)

- PJ: ***ǃ^ho-ĩ ~ *ǃ^ho-e** (Ju. *ǃ^húí ~ ǃ^hòà*, Kx. *!ɔ*, Kg. *ǃ^hwé ~ ǃwé*, Gr. *ǃ^hwi: ~ ǃ^hwi*, OK. *ǃwé*, Ek. *ǃ^hōē*). ◇ Preserved in all dialects; however, there are at least three different morphological variants of this stem, with ***ǃ^ho-ĩ** and ***ǃ^ho-e** being the most frequent ones, and ***ǃ^ho-a** only found in Ju. Although the origins of this diversity are unclear (probably a reflection of Pre-Proto-Ju's morphological productivity), the evidence seems to point to ***ǃ^ho-** as the original root for all these forms.
- ǃHoan: **ǃěamà** (C, G) ← ***tema**. ◇ The old non-palatalized variant *těmà* is still preserved in the Sasi dialect.
- Ju-ǃHoan: No lexicostatistical or clearly defined etymological parallels.

19. DRINK (±)

- PJ: ***ǃ^hĩŋ** (Ju. *ǃ^hì*, Kx. *ǃí*, Kg. *ǃĩŋ ~ ǃiŋ*, Gr. *ǃ^hĩ*, OK. *ǃí*, Ek. *ǃĩŋ*). ◇ Preserved in all daughter dialects. Coda reconstruction is not fully secure, but loss of the final velar nasal in Ju. is a recurrent phenomenon, so all the listed forms are unquestionably related.
- ǃHoan: **ǃū** (C, G).
- Ju-ǃHoan: Despite some obvious phonetic similarity, it is hard to reconcile the codas: although cases in which a final velar nasal in PJ seems to leave no trace in ǃHoan are relatively numerous (see corr. #16), the vocalic correspondence «PJ ***-i(ŋ)** : ǃHoan **-u**» remains unique. However, precise behavior of vowels in such specific contexts (between a palatal affricate and an unstable velar nasal coda) can hardly be predicted at the present time, and this means that the parallel can be provisionally accepted as a potential «weak» match.

20. DRY (-)

- PJ: ***!kxau** (Ju. *!kxáú*, Kg. *!áo ~ ǃáo ~ ǃào ~ ǃkxáo*, Gr. *!ǃau*, Ek. *ǃkxāō*). ◇ Preserved in all daughter dialects. Original retroflex click safely reconstructed based on the correspondence between Ju. and Ek.
- ǃHoan: **|q’au** (C).

- Ju-ǀHoan: No lexicostatistical or clearly defined etymological parallels. (An alternate synonym in Ju., /ɔ̀ ‘dry’, looks quite compatible with the form in ǀHoan, but has to be discarded as non-reconstructible for the PJ level and most likely recently borrowed from a Khoe source, along with numerous other secondary equivalents for basic terms in Ju.).

21. EAR (+)

- PJ: ***ǀʰuí** (Ju. /^huí, Kx. /wí, Kg. /úi, Gr. /^hwí, OK. /wí, Ek. /^huí). ◇ Preserved in all daughter dialects. PJ reconstruction relies on the full coincidence of the Ju. and Ek. forms.
- ǀHoan: |q^hǔē (C, G), |q^hǔĩ (SH).
- Ju-ǀHoan: Correspondences are completely regular, with the uvular component of the efflux in ǀHoan matching the glottalization in Ju (for a fully identical supporting example, cf. PJ *^hũ ‘steenbok’ = ǀHoan |q^hǔǔ id.); examples of «ǀHoan oe = Ju. ui» are scarce, but examples of «ǀHoan o = Ju u» are not (see corr. #12), so the vocalism is hardly problematic. ◇ HH: 29; SH: 253.

22. EARTH (+)

- PJ: ***kxà** (Ju. kxà, Kx. kxa, Kg. kxá, Gr. kxá, OK. kxa, Ek. kxà). ◇ Preserved in all daughter dialects. Reconstruction is based on the completely coinciding forms in Ju. and Ek. Neither any of the modern dialects nor, as may be inferred, PJ itself make any clear lexical differentiation between ‘earth’ and ‘sand’, due to specific landscape conditions of the Ju people.
- ǀHoan: **kxà** (C, G).
- Ju-ǀHoan: An obvious match. Complete phonetic identity between both forms is interpretable in terms of regular phonetic correspondences, i.e. there is no need to assume areal diffusion, particularly since the isogloss is exclusive to Ju and ǀHoan, but not to Tuu or Khoe. Of note, however, is the presence of the same word for ‘earth’ in Kwadi (Westphal 1966: 144), a language that is unrelated or very distantly related to Ju-ǀHoan, so in this case areal diffusion is a likely scenario. ◇ HH: 13, 24.

23. EAT (+)

- PJ: ***ǀm** (Ju. ǀm, Kx. m: ~ m, Kg. ǀm: ~ ǀm:, Gr. ǀm:, OK. m ~ ǀm, Ek. ǀm). ◇ Preserved in all daughter dialects. The root, just as it is attested in most dialects, should be reconstructed with a high-toned syllabic *ǀm preceded by a glottal stop (or a single preglottalized nasal consonant).
- ǀHoan: **ǀám** (C, G).
- Ju-ǀHoan: A perfect match. ǀHoan, unlike Ju languages, seems to generally lack syllabic nasal consonants, so the shift *ǀm → am is more probable than the opposite. ◇ HH: 14 (advocating for the reconstruction *am).

24. EGG (-)

- PJ: ***ǀũ** (Ju. ǀũ, Kx. ǀu:, Kg. ǀú, OK. ǀu ~ ǀú, Ek. ǀũũ ~ ǀóú). ◇ Preserved in all daughter dialects.
- ǀHoan: **k^hǔǔē** (C, G). ◇ The alternate form čxui ~ ǂ^hxui, found in Traill 1973: 29, is not confirmed in newer sources.
- Ju-ǀHoan: No lexicostatistical or clearly defined etymological parallels.

25. EYE (+)

- PJ: * ǃaʔā (Ju. ǃàʔá , Kx. ǃa , Kg. $\text{ǃá} \sim \text{ǃaá} \sim \text{ǃʔá}$, Gr. $\text{ǃəʔa} \sim \text{ǃʔa} \sim \text{ǃaʔa}$, OK. ǃa , Ek. ǃàʔā). $\diamond$ Preserved in all daughter dialects. Initial vowel is occasionally reduced, creating an odd «voiced glottalized» click effect (although such transcriptions are only attested in old sources).
- ǃHoan : ǃōā , pl. ǃōē (C, G).
- Ju- ǃHoan : Despite the lack of phonetic similarity, both forms can be reconciled by means of recurrent correspondences. Examples of the ǃHoan labial click corresponding to PJ dental */ also include such basic and semantically stable terms as ‘head’ q.v., ‘sky’ (ǃHoan $\text{ǃōa}^{\text{f}} = \text{PJ } *ǃaʔa$), ‘duiker’ (ǃHoan $\text{ǃʔu} = \text{PJ } *ǃau$), and possibly ‘one’ q.v. For the lack of voiced articulation in ǃHoan , see corr. #38a. As for the diphthong oa in ǃHoan , labial articulation here, judging by all attested cases of words with labial clicks, is automatic after such a click (corr. #1a)¹⁷. The word should probably be reconstructed as $*ǃaʔ-$, perhaps with an original paradigm of sg. $*ǃaʔ-a$, pl. $*ǃaʔ-i/N/$, levelled in PJ. $\diamond$ HH: 18, 27.

26. FAT (-)

- PJ: * ǃi (Ju. ǃái , Kx. ǃí , Kg. $\text{ǃí} \sim \text{ǃai} \sim \text{ǃáie}$, Gr. ǃái , OK. ǃí , Ek. $\text{ǃéi} \sim \text{ǃí}$). $\diamond$ Preserved in all daughter dialects (sometimes glossed as ‘fat’, sometimes as ‘oil’; there seems to be no lexical differentiation between the two meanings). Original $*-i$ diphthongized in Ju. and several other dialects.
- ǃHoan : $\text{ǃui} \sim \text{ǃʔui}$ (T). $\diamond$ Not very reliable (attested only in A. Traill's old publication).
- Ju- ǃHoan : If Traill's notation for ǃHoan is correct (although the strange variation between click effluxes makes it doubtful), the form is incompatible with the Ju. equivalent.

27. FEATHER (-)

- PJ: Same word as ‘hair’ q.v. (sometimes used in conjunction with ‘bird’ q.v.).
- ǃHoan : Same word as ‘hair’ q.v.
- Ju- ǃHoan : Same lack of lexicostatistical/etymological matches as in ‘hair’ q.v.

28. FIRE (-)

- PJ: * ǃàʔá (Ju. ǃàʔá , Kx. ǃà , Kg. $\text{ǃa} \sim \text{ǃʔa} \sim \text{ǃaá}$, Gr. $\text{ǃəʔa} \sim \text{ǃaʔa}$, OK. $\text{ǃà} \sim \text{ǃàa}$, Ek. ǃàʔà). $\diamond$ Preserved in all daughter dialects. First vowel sometimes gets reduced (see ‘eye’ for the same structure).
- ǃHoan : ǃoa (C, G).
- Ju- ǃHoan : No lexicostatistical or clearly defined etymological parallels.

29. FISH (?)

- PJ: Technically reconstructible for the PJ stage as * ǃau (Ju. ǃàù , Kg. ǃau , OK. ǃau , Ek. ǃáú). However, all attested forms are plausibly interpreted as borrowings from a Khoe source (cf. Proto-Khoe * ǃau ‘fish’); these borrowings may have taken place either before the disintegration of PJ or already after, but there is no reason to think of them as inherited from a Proto-Ju- ǃHoan , let alone earlier, stage of development. Ek. ǃòlō ‘fish’ is different, but etymologically obscure.

¹⁷ In HH: 18, labial articulation of the vowel is considered to be primary in such cases, with the authors reconstructing Proto-Kxa $*-oCa \rightarrow \text{ǃHoan } -o-a$, Ju $*-a-a$. However, since all of their examples involve items with ǃHoan labial clicks or, at least, another labial consonant in the vicinity, it makes more sense to assume secondary labialization of the vowel in ǃHoan .

- ǀHoan: Not attested.
- Ju-ǀHoan: Not reconstructible. The generic term ‘fish’ may not have existed in the protolanguage at all, given the geographical localisation of its descendants.

30. FLY (-)

- PJ: Technically not reconstructible; a slightly more probable candidate for proto-status is PJ **ǀom* (Ju. *ǀòm* ‘to fly’, *ǀòm-ǀ* ‘to fly over (a village)’ = Kx. *ǀo:a* ← **ǀom-a* ‘to fly about /of birds/’, OK. *ǀoa* ‘to mount up (in the sky)’), although all the parallels to the Ju. form are only attested in D. Bleek’s old records and are somewhat questionable, both phonetically and semantically. In Ek., no separate lexical root for the meaning ‘to fly’ is attested; cf., perhaps, *čāō* ‘to wake up, rise, stand up, fly up, jump up’ = Ju. *šáú* ‘to rise, get up’. Kx. *tē*, OK. *tē*: (as in *songu tē*: ‘the arrow flies’) are not confirmed in modern sources.
- ǀHoan: *kālā* (C, G). ◇ This form is clearly related to !Xóǀ *kála* ‘to go round, circle as vultures’, but the nature of the relationship (genetic? borrowing? if yes, in what direction?) remains unclear.
- Ju-ǀHoan: No lexicostatistical or etymological parallels. Overall, an unstable item that may not have had its own unique lexical representation at the Ju-ǀHoan level.

31. FOOT (≈)

- PJ: **ǀkxái* (Ju. *ǀkxái*, Kx. *|e ~ |xe*, Kg. *|kxe ~ |kxi ~ |xí ~ |e ~ |í*, Gr. *|ǀái ~ |xái*, OK. *|kxe ~ kxe*, Ek. *|kxái*). ◇ Preserved in all daughter languages.
- ǀHoan: *ǀáǀū* (C, G). ◇ Plural: *ǀǎǀū*.
- Ju-ǀHoan: No lexicostatistical parallels. However, the form in ǀHoan is comparable to PJ **ǀu^h* ‘track, footprint’ (Ju. *ǀū^h*, Ek. *ǀū*); consonantal correspondences here are recurrent (see corr. #35, #37a), and although the vocalic correspondence is rare (corr. #5), it is not totally unique (cf. also at least ǀHoan *ǀru* = PJ **ǀau* ‘duiker’), so we do not have any firm grounds to definitively reject the comparison. Acceptance of this etymology would imply that the ǀHoan form is more archaic in the meaning ‘foot’, since the semantic development ‘footprint’ → ‘foot’ is typologically far less likely than the opposite.

32. FULL (?)

- PJ: **ǀǎǀǐ* (Ju. *ǀǎǀǐ*, Kx. *ǀē ~ ǀēǐ*, Ek. *ǀǎǀǐ*). ◇ Preserved in all daughter dialects.
- ǀHoan: Not attested.

33. GIVE (-)

- PJ: **ǀaǀa* (Ju. *ǀǎ*, Kx. *ǀǎ ~ ǀa*, Kg. *ǀǎ ~ ǀǎ ~ ǀǎ ~ ǀǎ*, OK. *|a ~ |a*, Ek. *ǀǎǎ ~ ǀǎ*). ◇ This is the most common equivalent for ‘give’ in most of the dialects. Vocalic reconstruction is unclear: technically, the coda *-aǀa* accounts for most of the attested variations, but some of the developments would still have to be irregular (such as the contraction **ǀaǀa* → *ǀa* in some of the dialects). It is also unclear whether nasalization of the vowel has to be set up as a PJ feature or if it appears in Ju. and some other dialects secondarily. An additional PJ root is **na ~ *neǀe*, whose functions seem to be restricted to the imperative throughout: Ju. *nà*, Kx. *na*, Gr. *na*, OK. *na*, Ek. *nèǀè*. Finally, Kx. and Gr. yield evidence for a third root, **au* ‘give’, whose semantic difference from **ǀaǀa* cannot be established from available sources; strange enough, it is not confirmed at all by more modern and reliable sources on Ju dialects.
- ǀHoan: *šú* (C, G).
- Ju-ǀHoan: No lexicostatistical or clearly defined etymological parallels.

34. GOOD (-)

- PJ: ***žā** (Ju. *žā*, Kg. *žā* ~ *žā*, Gr. *žā*: ~ *žā*). ◇ This is the most common and probably the inherited term for ‘good’ in Ju dialects. Several other phonetically similar forms, such as Kx. *!āi*, Ek. *kāhí*, Gr. *gāi*, etc., do not correspond regularly to each other and are most plausibly explained as borrowings from various Khoe sources; cf. Proto-Khoe **!āi* ‘good’ → Nama *!āi*, !Ora, Naro *!āi*, East Khoe **kāi*, etc. (Vossen 1997: 445).
- †Hoan: **q^hāē** (C, G).
- Ju-†Hoan: No lexicostatistical or clearly defined etymological parallels. The †Hoan form is clearly the same word as !Xóǀ *qāi* ‘pretty, beautiful, nice’, but whether the similarity is due to common ancestry or recent borrowing remains unclear.

35. GREEN (-)

- PJ: ***!āŋu** (Ju. *!āũ^h*, Kx. *!āũ*, Kg. *!áŋ* ~ *!àŋ* ~ *!aŋ* ~ *!ũŋ*, OK. *!āŋ*, Ek. *!āŋ*). ◇ Judging by available semantic notation, the root must have denoted the entire ‘blue/green/yellow’ spectrum in PJ. Reconstruction of the coda *-*aŋu* is set up to account for the correspondence between Ju *-āũ* and Ek. *-aŋ*.
- †Hoan: **za^ʔʔa** (T). ◇ Attested only in A. Traill's old publication, so somewhat dubious.
- Ju-†Hoan: No lexicostatistical or clearly defined etymological parallels.

36. HAIR (-)

- PJ: ***!kxuí** (Ju. *!kxuí*, Kx. *!kxwe* ~ *!kxwi* ~ *!kwi*, Kg. *!kxwé* ~ *!kxwí*, Gr. *!kxwi*, OK. *kxwi* ~ *!wi*, Ek. *!kxuí*). ◇ Preserved in all daughter dialects. No lexical difference between ‘head hair’ and ‘body hair’.
- †Hoan: **ǃu** (C), **ǃù** (SH).
- Ju-†Hoan: No lexicostatistical or clearly defined etymological parallels.

37. HAND (+)

- PJ: ***!ǃau** (Ju. *ǃáú*, Kx. *ǃou* ~ *ǃau*, Kg. *ǃau*, Gr. *ǃāù*, OK. *ǃau*, Ek. *ǃàò* ~ *ǃāò*). ◇ Preserved in all daughter dialects. Correspondences indicate an original voiced retroflex click, still preserved in the Grootfontein dialect.
- †Hoan: **šiu** (C, G), **síu** (SH). ◇ The more archaic Sasi form is *šáu*. Odd consonantal gradation in the plural form: *čěō-qà* (C, G).
- Ju-†Hoan: PJ **ǃau* and †Hoan *šiu* are tied together by recurrent correspondences (#5a, #35b, #38a) and can be reliably traced back to the same proto-root. Cf. a perfect near-homonymous example in Ju. *ǃàú* ‘to dig’ (← **ǃau*?) = †Hoan *šiu* (C) ‘to dig’. ◇ The possible connection is mentioned, but rejected in HH: 17, because the authors have not located the additional evidence for this correspondence.

38. HEAD (+)

- PJ: ***ǃé** (Ju. *ǃái*, Kx. *ǃé* ~ *ǃé* ~ *ǃi* ~ *ǃí*, Kg. *ǃé*, Gr. *ǃé*, OK. *ǃé*, Ek. *ǃē*). ◇ Preserved in all daughter dialects. Preglottalized nasal click is reconstructed based on Ekoka data.
- †Hoan: **ǃǃú** (C, G), **ǃǃú** (SH).
- Ju-†Hoan: Despite the lack of phonetic similarity, Ju and †Hoan forms are connected by recurrent correspondences. The labial click in †Hoan corresponds to the dental click in Ju (corr. #32a), while the preglottalized nasalized efflux in Ek. and †Hoan coincide precisely. Labial vowel articulation in †Hoan is automatic after a labial click, and nasalization of the vowel may be secondary (influence of the nasal click, or a trace of some old

morphological feature). The hypothetical protoform would presumably look like **ǀe-* on the Proto-Ju-ǀHoan level¹⁸.

39. HEAR (+)

- PJ: **sàǀā* (Ju. *càǀá*, Kx. *cá ~ ča*, Kg. *sá ~ ssá ~ ssaǀ ~ saǀ*, Gr. *sǀǀá*, OK. *sáa ~ saa*, Ek. *čà ~ čǀǀā*). ◇ Preserved in all daughter dialects. Fluctuation between affricate (*c-*) and fricative (*s-*) articulation is resolved in favor of the fricative articulation as original; affricativization probably occurs under the influence of the glottal stop, especially considering that the first half of the complex vowel sequence is frequently reduced or even completely deleted in the actual articulation.
- ǀHoan: *cǀ* (C, G).
- Ju-ǀHoan: The forms are perfectly compatible (ǀHoan *c-* is a regular correspondence for PJ **s-*; lack of the glottal stop in ǀHoan is the same as in ‘eye’ q.v.). ◇ HH: 23 (reconstructed with **c-*).

40. HEART (-)

- PJ: **!kxā* (Ju. *!kxá*, Kx. *!a*, Kg. *!kxá ~ !xá*, Gr. *!a*, OK. *kxa*, Ek. *!kxā*). ◇ Preserved in all daughter dialects. The velar affricate efflux is transcribed inconsistently in old sources, but these inconsistencies are not enough to amend the reconstruction, based on modern data from Ju. and Ek. Most of the dialects also reflect polysemy ‘heart/inside’, likely inherited from the PJ state.
- ǀHoan: *!qǀǀ* (C, G).
- Ju-ǀHoan: There are no other plausible cases where PJ **kx* (either as a non-click phoneme or as a click efflux) could be correlated with ǀHoan **q*; vocalic correspondences cannot be properly resolved, either, implying that the two forms are not related.

41. HORN (+)

- PJ: **!hú* (Ju. *!hú*, Kx. *!u: ~ !ú*, Kg. *!ú ~ !hú ~ !xú*, Gr. *!!ú*, OK. *!hú*, Ek. *!hú*). ◇ Preserved in all daughter dialects. Doke's transcription of a retroflex click for the Grootfontein dialect, instead of an alveolar one, is most likely erroneous, since it is not supported by any data outside that source.
- ǀHoan: *!hǀ* (G). ◇ Also attested in the reduplicated variant *!hǀo-!hǀo*.
- Ju-ǀHoan: A perfect etymological/lexicostatistical match with regular correspondences. ◇ HH: 28.

42. I (+)

- PJ: **mí* (Ju. *mí*, Kx. *m ~ me ~ mi*, Kg. *m ~ mé ~ mi ~ mĩ*, Gr. *mí*, OK. *m ~ me ~ mi*, Ek. *mí ~ mā*). ◇ Preserved in all daughter dialects, along with the emphatic stem **mi-hi*. A very rare case of word-initial **m-*, reliably reconstructed for the PJ level.
- ǀHoan: *ma* (C, G). ◇ Cf. also the possessive form: *ǀàm* ‘my’.
- Ju-ǀHoan: A clear match, although the vocalism remains unclear. Considering that both *mí* and *mā* are encountered in Ek., partially distributed depending on syntactic function (König & Heine 2001: 49), it is possible that both variants were already present in Proto-Ju-ǀHoan. ◇ HH: 14.

¹⁸ In [Sands, Honken 2014: 249] it is tentatively suggested that the ǀHoan form may be related to *!Xóǀǀ ǀǀú:* ‘louse’ as a loan. Despite the phonetic similarity (involving a relatively rarely encountered labial click), a semantic shift from ‘head’ to ‘louse’ or vice versa is so completely unprecedented that the Ju-ǀHoan etymology must take precedence here.

43. KILL (+)

- PJ: *^hú (Ju. ^hú, Kx. ^hú, Kg. ^hú ~ ^hú ~ ^hú, Gr. ^hú, OK. ^hú ~ ^hú, Ek. ^hú ~ ^hú). ◇ Singular action stem; the corresponding plural action stem is harder to reconstruct, since the two main attested forms, Ju. ^hú (← *^hú, cf. Kx. ^hú id.) and Ek. ^hú, do not properly correspond to each other. Amendment of the reconstruction to *^hú (cf. the variation in Ek.) is not out of the question, but on the whole, the correspondences seem rather suggestive of a nasalized vowel as the original coda.
- †Hoan: ^hú (G). ◇ Singular action stem; the plural correlate is ^hú (C, G).
- Ju-†Hoan: Singular action stems correspond to each other precisely; their plural action correlates seem to be less stable and are historically incompatible. ◇ HH: 19, 28.

44. KNEE (≈)

- PJ: *^hú (Ju. ^hú, Kx. ^hú, Kg. ^hú ~ ^hú, Gr. ^hú, Ek. ^hú). ◇ In OK., the only attested equivalent for ‘knee’ is ^hú ~ ^hú (the second variant shows irregular click loss) = Ek. ^hú ‘knee-cap’; this is possibly an archaic root with this meaning, whereas most of the modern dialects use the compound form ‘knee-head’ (e.g. Ek. ^hú ^hú; cf. also the form in Kx.) instead.
- †Hoan: ^hú (C, G). ◇ Cf. also ^hú ‘to kneel’.
- Ju-†Hoan: No lexicostatistical matches. However, the †Hoan form is comparable to Ju. ^hú ‘to kneel’ (no known parallels in other Ju dialects); discrepancies in vocalism may imply that the †Hoan form is an old derivative from the verb ‘to kneel’ — *^hú → ^hú with assimilation (of note is the ultra-low tonal characteristics in both languages).

45. KNOW (-)

- PJ: *^hú (Ju. ^hú, Kg. ^hú ~ ^hú, Gr. ^hú). ◇ This root is only preserved in the Southern dialect cluster. Its main alternative is OK. ^hú, Ek. ^hú ~ ^hú, which corresponds to the widespread (but not attested in Ju.) root *^hú (Snyman 1997: 94) that means ‘to be able to, to know how (to do smth.)’ in several other dialects. This lexical distinction may be set up for the PJ level (*^hú ‘to know smth.’ — *^hú ‘to know how to do smth.’).
- †Hoan: ^hú (C, G). ◇ Probably the same word as ‘to see’ q.v.; distinct from ^hú ‘to know how’.
- Ju-†Hoan: PJ *^hú is clearly the same root as †Hoan ^hú, reflecting a common Proto-Ju-†Hoan root with the meaning ‘to be able, to know how’ (HH: 28). However, there are no direct lexicostatistical matches for the required meaning ‘to know (smth.)’: †Hoan has seemingly merged this meaning with ‘to see’, whereas PJ *^hú is either archaic or may be itself borrowed from a Khoe source (cf. Proto-Khoe *^hú ‘to know’).

46. LEAF (-)

- PJ: (?) *^hú (Kg. ^hú, Ek. ^hú). ◇ The basic form for ‘leaf’ in Ek. corresponds to Ju. ^hú ‘wet leaf’ (with a slight irregularity, since there is no pharyngealization in Ju.) and possibly to OK. ^hú: ‘leaf’ with irregular click loss. The following alternate roots have been excluded from comparison for various reasons: (a) Ju. ^hú, Kx. ^hú ‘leaf’; this is an areal isogloss with Naro ^hú ‘leaf’, a word that also lacks a proper Common Khoe etymology and should probably be ascribed to some local substrate, affecting geographically contiguous areas occupied by Ju|hoan and Naro speakers; (b) Kg. ^hú, Gr. ^hú ‘leaf’ = Ju. ^hú ‘to come into leaf (vb.); leaf, cabbage (n.)’, a root that is hard to separate from the phonetically similar ^hú ‘to swell, be bloated’ and whose primary meaning is most likely verbal.

- ǀHoan: *ʒòʔbā* (C, G). ◇ Cf. Sasi *dòʔbā* id., reflecting the original coronal articulation.
- Ju-ǀHoan: No lexicostatistical matches. It is tempting to compare Ju. *dòʔrà* with Sasi *dòʔbā*, since the first syllable of both words is identical (right down to the pharyngealized articulation of the vowel); however, the second syllable is a stark mismatch, and given the observations about the areal connection between Julhoan and Naro, it is possible that the ǀHoan form was borrowed separately from a distinct dialect of the same substrate (e.g. if **doʔ-ra* and **doʔ-ba* were morphologically different variants in these dialects). In any case, unless more correspondences between nominal structures **CV-ra* and **CV-ba* are discovered between Ju and ǀHoan, it is premature to speak about common inherited lexemes in this particular case. ◇ In HH: 19, the Ju-ǀHoan match is accepted, but no explanation is provided for the morphological differences, and the areal distribution of the Ju form is not taken into account either.

47. LIE (-)

- PJ: **šú* (Ju. *šú*, Kx. *šu* ~ *šú*, Kg. *šú* ~ *šù*, Gr. *šú*, OK. *šú* ~ *ču*, Ek. *šú*). ◇ Singular action verb; its plural action correlate is PJ **šà* (Ju. *šà*, Ek. *šà*). Preserved in all daughter dialects.
- ǀHoan: *ǀqíʔi* (C, G). ◇ Singular action verb; plural action correlate is *ǀqʰǎu*.
- Ju-ǀHoan: No lexicostatistical matches. It is possible to compare ǀHoan *ǀqʰǎu* ‘to lie (pl.)’ with PJ **šʰo* ‘to sit (pl.)’ (q.v.), with a slight semantic shift and generally regular phonetic correspondences; however, no clear etymological parallels for ǀHoan *ǀqíʔi* have been found in PJ.

48. LIVER (-)

- PJ: **čij* (Ju. *čij*, Kx. *čij*, Kg. *čij*, Gr. *šij*, OK. *čij*, Ek. *šij*). ◇ Preserved in all daughter dialects. The correspondence between Ju. *č(h)*- and Ek. *š*- is irregular, possibly reflecting a specific development **č* → *š* before a syllabic nasal.
- ǀHoan: *kúi* (C, G).
- Ju-ǀHoan: No lexicostatistical or clearly defined etymological parallels.

49. LONG (-)

- PJ: **ǀaʔŋ* (Ju. *ǀǎʔŋ*, Kx. *ǀē*, Kg. *ǀaʔáŋ* ~ *ǀǎʔŋ* ~ *ǀaʔŋ*, Gr. *ǀaʔŋ* ~ *ǀǎʔŋ*, Ek. *ǀǎʔŋ*). ◇ Preserved in the majority of daughter dialects; the only deviation is found in OK., where Bleek lists *ǀxana* as the main equivalent for ‘long’ = Ju. *ǀxǎ* ‘far’, perhaps with additional suffixation. Coda reconstruction is not entirely secure, but the presence of a segmental nasal **-ŋ* most certainly is.
- ǀHoan: *čǎʔa* (C, G). ◇ Usually glossed as ‘tall’, but also as ‘long’ in Traill 1973: 30; there is no reason to suspect any lexical differentiation between the two submeanings.
- Ju-ǀHoan: No additional evidence has been uncovered so far for the possibility of click affricativization **ǀ* → *č* in ǀHoan, so the two forms have to be judged as incompatible.

50. LOUSE (+)

- PJ: **cʰij* (Ju. *cʰij*, Ek. *šij*). ◇ Attested only in modern sources, but well reconstructible for PJ based on the Ju.-Ek. isogloss, although the voicing in Ek. is irregular (additional dialectal forms in Snyman 1997 show that voiceless **cʰ* is primary).
- ǀHoan: *cʰi* (G). ◇ After Honken 1988: 64, cf. also *cʰi* in Traill 1973: 30.
- Ju-ǀHoan: Both forms are perfectly compatible (see corr. #16 for the lack of the nasal coda in ǀHoan).

51. MAN (-)

- PJ: *!ʰõã (Ju. !ʰõã, Kx. !wã, Kg. !ũ ~ !ù ~ !ùŋ ~ !ʰũ, OK. !ũ). ◇ In some dialects, the only form attested in the meaning ‘man = male human being / husband’ is PJ *!o^ʰ (Gr. !o:, Ek. !ò); in Ju. and several other dialects, however, the two roots are well distinguished, so that *!ʰõã has the more narrow meaning ‘male human being’ and *!o^ʰ has the wider meaning ‘male’ (including, or sometimes restricted to, male animals). This is likely to have been the situation in PJ. Phonetically, the reconstruction *!ʰõã is problematic; attested variants presuppose at least four irreconcilable variants (Ju. !ʰõã, Kx. *!õã, Kg. *!ũ, OK. /Snyman/ !xũ = Ek. !xũũ ‘!Xun person’). Mechanistically tracing them back to four different proto-entries does not make sense; it is more likely that the Ju. variant is the most archaic, whereas the old sources fail to properly transcribe aspiration. As for the velar fricative efflux -x- in the Northern cluster, it may have appeared secondarily through contamination with *!xuni ‘to live, reside’ (cf. Ek. !xúnní, etc.). Finally, worth noting is the suppletive plural form *!ae^ʰ ‘men, males’: Ju. !ãè^ʰ, Gr. !ãì, Ek. !ãē.
- †Hoan: !ãrĩ-žã (C, G). ◇ Suppletive plural: !ãò ‘men’. The second part of this compound by itself (žã) is used in the meaning ‘husband’.
- Ju-†Hoan: No lexicostatistical or clearly defined etymological parallels.

52. MANY (≈)

- PJ: *!ʰí (Ju. !ʰái, Kx. !ʰí, Kg. !ʰí ~ !xí ~ !xì, Gr. !ʰí, OK. !ʰí ~ !ʰí ~ !ʰí-!ʰí, Ek. !ʰí). ◇ Preserved in all daughter dialects. Click efflux is reconstructed as simple aspiration, despite the (probably erroneous) transcription with a glottal stop in Doke's Grootfontein materials. The original vowel is *-i, undergoing regular diphthongization in Ju.
- †Hoan: kĩ=žõa (C, G). ◇ Cf. the form without the plural prefix in Traill 1973: 30: žua ~ žũã.
- Ju-†Hoan: No lexicostatistical parallels, but PJ *!ʰí is cognate with †Hoan !ʰĩ ‘big’ q.v.

53. MEAT (≈)

- PJ: *!ʰã (Ju. !ʰá, Kx. !ʰa: ~ !á ~ !á: ~ !a, Kg. !ʰá ~ !ʰà ~ !a, Gr. !ʰá ~ !a:, OK. !ʰa, Ek. !ʰã). ◇ Preserved in all daughter dialects; correspondences indicate an original retroflex click, still preserved in the Grootfontein dialect.
- †Hoan: !ãè^ʰ (C, G). ◇ Cf. also !a: ‘animal’ (Traill 1973: 29): possibly the same root or even the same word (mistranscribed?), considering the natural polysemy ‘meat/animal’ in South African languages.
- Ju-†Hoan: In HH: 14, the †Hoan form is compared with Ju. !ã?é ‘to slaughter; to cut meat’; this is acceptable if the †Hoan noun originally meant something like ‘stripe/slice of meat’, i.e. represented a nominalization of the original verb. However, this is obviously not a lexicostatistical match.

54. MOON (≈)

- PJ: *!ũí (Ju. !ũí, Kx. !wi, Kg. !wí ~ !wái ~ !wi, Gr. !wi, OK. !wi ~ !we, Ek. !ũí). ◇ Preserved in all daughter dialects. Correspondences clearly indicate a retroflex click in PJ.
- †Hoan: !ĩbĩ (C, G).
- Ju-†Hoan: No lexicostatistical parallels. However, the †Hoan form is comparable with Ju. !ã?àbè ‘shiny’; all correspondences are recurrent (for the possible assimilative development *CaCI → CiCI in †Hoan, see ‘knee / to kneel’ above plus additional examples, e.g. †Hoan !ĩbi ‘dove’ = Ju. !ái-!ábí id., †Hoan !ĩ?ni ‘to refuse’ = Ju. !ãní ‘to dissuade’,

corr. #1b), and the semantic shift from ‘to shine, shiny’ to ‘moon’ belongs to the trivial type. This would imply that the PJ equivalent for ‘moon’ may be more archaic. An alternate (but, it must be noted, not necessarily mutually exclusive) comparison for Ju. ǀǀàǀàbè is ǀHoan ǀǀǀǀǀǀǀǀǀ ‘white’ q.v.

55. MOUNTAIN (-)

- PJ: *ǀǀǀǀǀǀ (Ju. ǀǀǀǀǀ, Kx. ǀǀǀǀǀ, Kg. ǀǀǀǀǀ, Gr. ǀǀǀǀǀ, OK. ǀǀǀǀǀ, Ek. ǀǀǀǀǀ). ◇ Preserved in all daughter dialects. There is, however, an unresolved problem connected with the polysemy ‘stone/mountain’. Both of the major sources on Ekoka (König & Heine 2008; Heikkinen 1986) agree that this word, glossed as ‘hill’, is pronounced with a pre-glottalized nasal click rather than the regular nasal click, while ‘stone’ just has the regular nasal click — i.e. that we are dealing with two different roots. This is a very odd observation, considering the frequent and natural character of the ‘stone/mountain’ polysemy in African (and world) languages and, at the same time, the impossibility to explain this difference in terms of morphological derivation. It may be further noted that C. Doke also marks a difference between the two words, but in his notation it is purely tonal (ǀǀǀǀǀ ‘mountain’ vs. ǀǀǀǀǀ ‘stone’), and while such a differentiation may be easier to explain in terms of historical derivation (tonal alternations actually exist in Ju), it can hardly be correlated with the difference in click effluxes as observed in Ekoka. Naturally, since Ekoka is the only dialect in which the difference between the two types of nasal clicks has been systematically observed and notated, in all the other dialects *ǀǀǀǀǀ ‘mountain’ and *ǀǀǀǀǀ ‘stone’ would be expected to look completely identical.
- ǀHoan: ǀǀǀǀǀ (C).
- Ju-ǀHoan: No lexicostatistical or etymological parallels.

56. MOUTH (±)

- PJ: *ǀǀǀǀǀ (Ju. ǀǀǀǀǀ, Kx. ǀǀǀǀǀ ~ ǀǀǀǀǀ, Kg. ǀǀǀǀǀ ~ ǀǀǀǀǀ, Gr. ǀǀǀǀǀ, OK. ǀǀǀǀǀ ~ ǀǀǀǀǀ, Ek. ǀǀǀǀǀ). ◇ Preserved in all daughter dialects.
- ǀHoan: ǀǀǀǀǀ (C, G).
- Ju-ǀHoan: Although the basic consonantal structures (as well as the main vowel) for both forms are perfectly compatible, and nasalization in ǀHoan is negligible, proper common etymologization is seriously hampered by the fact that PJ *ǀǀǀǀǀ would be expected to correspond to ǀHoan ǀǀǀǀǀ rather than ǀǀǀǀǀ (see ‘sleep’, ‘tooth’), whereas ǀHoan ǀǀǀǀǀ, in turn, corresponds to either PJ *ǀǀǀǀǀ or a retroflex click, but not *ǀǀǀǀǀ. The only way to circumvent this issue would be to set up a more complex protoform, e.g. *ǀǀǀǀǀǀ, with an irregular (or a contextually unique) reduction + affricativization → *ǀǀǀǀǀ → *ǀǀǀǀǀ in PJ and contraction + palatalization → *ǀǀǀǀǀ → ǀǀǀǀǀ in ǀHoan. Whether this scenario can be plausibly justified remains to be seen; however, it is not out of the question, and given the undeniable phonetic similarity between the two words, we can count this entry as a potential «weak» match.

57. NAME (+)

- PJ: *ǀǀǀǀǀ (Ju. ǀǀǀǀǀ, Kx. ǀǀǀǀǀ ~ ǀǀǀǀǀ, Kg. ǀǀǀǀǀ ~ ǀǀǀǀǀ ~ ǀǀǀǀǀ, Gr. ǀǀǀǀǀ, OK. ǀǀǀǀǀ, Ek. ǀǀǀǀǀ). ◇ Preserved in all daughter dialects. Unexpected dental (rather than alveolar) click transcription in Doke's Grootfontein data might simply be a misprint.
- ǀHoan: ǀǀǀǀǀ (C, G).
- Ju-ǀHoan: A perfect etymological and lexicostatistical match. ◇ HH: 17, 25 (reconstructed with the diphthong *ou to reflect the regular correspondence between Ju *u and ǀHoan *o).

58. NECK (-)

- PJ: ***!àŋi** (Ju. *!àṽ*, Kx. *!ēṽ*, Kg. *||āŋ ~ ||āũŋ*, Gr. *!āŋ*, OK. *||āŋ*, Ek. *||āŋ*). ◇ Preserved in all daughter dialects. Retroflex click securely reconstructed, based on regular correspondences between Ju., Gr., and Ek. Coda correspondences fall under the recurrent pattern «Ju. *-āṽ ~ -āũ* : Ek. *-aŋ*» that we provisionally mark as reflecting PJ **-aŋi* and **-aŋu* respectively.
- †Hoan: **ɕ^hyā ~ ɕ^ha** (C, G).
- Ju-†Hoan: No lexicostatistical or etymological parallels.

59. NEW (+)

- PJ: ***ʒe** (Ju. *zé ~ zàṽ*, Kx. *zé*, Kg. *zε-ma*, Gr. *ze:*, OK. *ʒe*, Ek. *žèhè*). ◇ Preserved in all daughter dialects. Correspondences are mostly regular and trivial, with the exception of the tonal pattern that ranges from simple rising in Ju. to ultra-low in Ek. It is not quite clear if the Ju. form *zàṽ*, with a diphthong and pharyngealization, is merely a dialectal variant or a different root.
- †Hoan: **zà** (C, G).
- Ju-†Hoan: An acceptable lexicostatistical match. The vocalic correspondence between PJ **e* and †Hoan *a* (rather than *e* or *i*) is almost unique, but it should be noted that monophthongic **e* is very rare in PJ, and examples of PJ-†Hoan matches where it is present are even more scarce; for possible confirmation of regularity, cf. PJ **h=e* — †Hoan *ha* ‘this’ q.v., PJ **ge* ‘to stay /in a place/’ — †Hoan *ga* ‘to rise /pl./’ (although the latter example is semantically questionable). Additionally, it is not excluded that PJ **ʒe* ← **ʒa-I* with suffixation (cf. in that respect the odd variant *zàṽ* in Ju.).

60. NIGHT (-)

- PJ: ***!ú** (Ju. *!ú*, Kx. *!u ~ !u:* ~ *!ú*, Kg. *!ú ~ !u*, Gr. *!ú:*, OK. *!ú*, Ek. *!ú*). ◇ Preserved in all daughter dialects.
- †Hoan: **ɕ^hāo** (C, G).
- Ju-†Hoan: No lexicostatistical matches. Cf., perhaps, †Hoan */u* (C) ‘yesterday’ as a possible etymological match for the PJ form (although the semantic link is problematic).

61. NOSE (-)

- PJ: ***ckxúŋ** (Ju. *cúṽ*, Kx. *čũ*, Kg. *s:ũ ~ cũ ~ càŋ ~ cáũ*, Gr. *cũ*, OK. *cũŋ ~ cáŋ ~ čn*, Ek. *čkxánŋ ~ čŋ*). ◇ Preserved in all daughter dialects; however, correspondences here are rare and complex. In the initial position, Ek. and some other dialects point to an original affricate cluster **ckx-* that must have been phonologically opposed to the simple glottalized affricate **čʔ-* in PJ. The coda contains a velar nasal, presumably with a preceding labial vowel (reflecting the correspondence «Ju. *-ũ* : Ek. *-(a)ŋ*»), although this particular part of the reconstruction is provisional.
- †Hoan: **!q^ʔǎ** (C, G).
- Ju-†Hoan: Despite some phonetic similarity between the two forms (vocalism, glottalic articulation, etc.), there is no evidence to support click loss in PJ (or secondary click formation in †Hoan).

62. NOT (+)

- PJ: ***!ōā** (Ju. *!óá*, Kx. *!wa ~ !ua:* ~ *!á*, Kg. *!úú ~ !úi*, OK. *!wa ~ !we ~ !wí ~ kwé ~ kwí*, Ek. *!ōā*). ◇ Preserved in all daughter dialects. Note irregular click loss in some OK. subdialects, possibly caused by frequent usage of this auxiliary morpheme.

- ǀHoan: ǀʰǀǀ ~ ǀʰǀǀǀ (C, G). ◇ The Sasi form is recorded as ǀǀǀ.
- Ju-ǀHoan: Although correspondences between click effluxes are clearly irregular, unexplained fluctuation is already observable on the synchronic level within ǀHoan itself; taking into consideration the auxiliary (grammatical) function of this negative particle, making it more prone to various irregular developments (e.g. of an assimilative nature, or resulting from undetected contractions with other auxiliary morphemes, etc.), we tentatively count this pair, reduced to the basic shape */U-, as an etymological and lexicostatistical match.

63. ONE (+)

- PJ: *ǀǀǀǀ (Ju. ǀǀǀǀ, Kx. ǀǀ ~ ǀǀǀ, Kg. ǀǀǀ, Gr. ǀǀǀǀ, OK. ǀǀ, Ek. ǀǀǀ ~ ǀǀ). ◇ Preserved in all daughter dialects.
- ǀHoan: ǀǀǀ (C, G).
- Ju-ǀHoan: Despite apparent phonetic dissimilarity, correspondences between these two items are actually quite regular: ǀHoan ǀǀ is a perfect match for PJ *ǀǀ, and differences in vocalism are explained by the general labialization of vowels in ǀHoan after a labial click (actually, this is the same correspondence as in ‘head’ q.v.).

64. PERSON (≈)

- PJ: *ǀǀǀ (Ju. ǀǀ, Kx. ǀǀ, Kg. ǀǀ ~ ǀǀ, OK. ǀǀ ~ ǀǀ). ◇ This is one of the few Ju words that may have relied on tonal alternations to form the plural, something that is still preserved in modern Ju. (pl. ǀǀ); cf., however, such plural forms as Kx. ǀǀ-si, Kg. ǀǀ-si, indicating productive analogical reformation in various dialects. The word occasionally gets lost or semantically shifted: cf. Gr. *atā* ‘person’ (an unclear replacement, seemingly of non-native origin due to its violation of standard Ju phonotactics; in the plural number, however, the old word is still retained as ǀǀ: ~ ǀǀ: ‘people’); Ek. *!xǀǀ* ‘person’, with the old word ǀǀ apparently shifting to the pronominal meaning ‘we /excl./’. Special mention must be made of the compound form *ǀǀ-ǀǀǀ, lit. ‘true person’, denoting North Khoisan-speaking people; given its presence in both Ju. and Ek., it is reconstructible for PJ as an archaic ethnic self-designation.
- ǀHoan: ǀǀǀ-ǀǀǀ (G). ◇ Clearly a compound; second part may be a general morpheme for denoting people (cf. ǀǀǀ-ǀǀǀ ‘Bushman’) and is possibly of Central Khoisan origin (cf. Proto-Khoe **kʰoe* ‘person’). The first part, however, cannot be explained away as a borrowing. Suppletive plural: ǀǀǀ-ǀǀǀ ‘people’ (C, G).
- Ju-ǀHoan: No lexicostatistical matches. In Ju., the word ǀǀǀ means ‘south’; this agrees with the etymology of the exoethnonym ‘ǀHoan’ (= !Xóǀ ǀǀǀǀ ‘south’) and formally permits to reconstruct Proto-Ju-ǀHoan *ǀǀǀ ‘South’. If so, the Ju equivalent for ‘person’ is probably more archaic, which is made even more likely by its non-trivial paradigmatic features (tonal alternation as a grammatical means). Unfortunately, regular correspondences to PJ *ǀ- in ǀHoan remain unknown, so the word *ǀǀ could be compared to either (a) ǀHoan ǀǀǀ in ǀǀǀ-ǀǀǀ ‘people’ (where the second component is an additional plural marker) or (b) ǀHoan ǀǀ ‘husband’. Comparison (b) is more phonetically similar in respect to consonantism, but not vocalism; comparison (a) is cumulatively better both phonetically and semantically, but would still need to be confirmed by further examples. In the absence of contradictory cases, we may still count it as a tentative etymological match.

65. RAIN (-)

- PJ: ***!à** (Ju. *là*, Kx. *là*, Kg. *lla* ~ *!a*, Gr. *ɲ!a*, OK. *lla* ~ *là* ~ *ga*, Ek. *là*). ◇ Preserved in all daughter dialects. For future purposes (such as tracing various morphophonological processes in the history of Khoisan linguistic lineages), it is perhaps worth noticing the similarity with ***!ú** ‘water’ (see below), although the two roots were clearly distinct even on the PJ level.
- †Hoan: *čō?ā* (C, G).
- Ju-†Hoan: No lexicostatistical or etymological parallels.

66. RED (+)

- PJ: ***!ā** ~ ***!ae** (Ju. *lā*, Kx. *lā*, Kg. *lā* ~ *la*, Gr. *lā?ā*, OK. *lāi*, Ek. *lāē*). ◇ Preserved in all daughter dialects. However, while the Northern dialect cluster points to PJ **!ae*, the rest of the dialects rather agree on PJ **!ā*. This may be interpreted either as a rare, non-trivial combination of features (e.g. some special nasalized diphthong), or, more likely, as two morphological variants, indicating that the original root was simply **!a-* and that it became fused with two different suffixal extensions (**!a-e* vs. **!a-N*).
- †Hoan: *!ā?a* (C, G).
- Ju-†Hoan: A perfect lexicostatistical and etymological match, especially if we interpret internal Ju evidence as reflecting original **!a-*. For the correspondence between PJ voiced and †Hoan voiceless effluxes, see corr. #38a.

67. ROAD (?)

- PJ: ***!hà** (Ju. *hà* ‘path’, Kx. *la*, Kg. *hà*, OK. *la*, Ek. *hà*). ◇ This is almost certainly the original PJ root denoting the default means of getting from one place to another (Dorothea Bleek seems to have mistranscribed a dental click for both Kx. and OK. instead of palatal articulation — a rather common error in her records). For modern languages, dictionaries occasionally observe lexicalized oppositions between the older ‘path’ and the more recent ‘road’ (= ‘enlarged path between settlements’), cf. Ju. *lāmà* (no etymology); Kg. *kú*, Ek. *kùhù* (originally, perhaps, = ‘footprint’, as this meaning is also attested for Kg.). Such oppositions are likely to reflect quite recent developments.
- †Hoan: *zèo* (C, G) ← ***dao**. ◇ The more archaic form *dão* is still preserved in the Sasi dialect.
- Ju-†Hoan: †Hoan **dao* ‘path, road’ is phonetically identical with !Xóõ *dào* and, further still, with Proto-Khoe **dao* ‘road’; this is an areal word, ultimately of Khoe origin, that has replaced the original †Hoan term for this Swadesh meaning and must be excluded from lexicostatistical comparison.

68. ROOT (-)

- PJ: (?) ***!ani** (Ju. *lani*, Kx. *lāi*). ◇ This Swadesh meaning is unstable in Ju, and semantic reconstruction is hindered by inadequacy of existing semantic descriptions. An alternate candidate for PJ status is the root ***!ari**, cf. Ek. *lālí* ‘root; handle’, OK. *llale* ~ *llare* ‘branch (?); root fibre’, Kx. *llari* ‘root fibre’, Kg. *lleri* ‘root fibre’, Ju. *lārì* ‘root’ (copied by Dickens from the earlier dictionary of J. Snyman); it is, however, seen here that most of the old sources have it in the specific meaning ‘root fibre’, so it is unclear if it should be properly eligible for straightforward semantic comparison. Cf. also Kg. *!ubbe* ‘root’, of unclear origin, perhaps = Ju. *!úbè* ‘species of shrub’. We very tentatively go along with Dickens' data on Ju., setting up **!ani* (or **!lani*, since diagnostic parallels in Northern dialects are lacking) as the potential protoform.

- ǀHoan: **!qʔai** (C). ◇ Since the form is not attested in texts, it is not clear whether this is truly the generic term for ‘root’ in the language. Cf. other attested terms meaning ‘a kind of root’, e. g. *!one*, *ǁgama* etc.
- Ju-ǀHoan: No lexicostatistical or etymological parallels.

69. ROUND (?)

- This meaning is almost never attested in any of the available lexicographic sources on either Ju or ǀHoan languages; the very concept of ‘roundness’ of an object is seemingly not inherent to these lineages, aside from a few very recent borrowings.

70. SAND (?)

- PJ: ***kxà**. ◇ Same word as ‘earth’ q.v.
- ǀHoan: Not attested. Possibly also same word as ‘earth’.

71. SAY (±)

- PJ: ***kò** (Ju. *kò*, OK. *ka* ~ *ke*, Ek. *kòè* ~ *kwèé* ~ *kūyā*). ◇ Reconstructed based on the isogloss between OK. and Ek.; original root vocalism is not quite certain due to elements of suffixation in daughter dialects (cf. *ka* ~ *ke* in OK.). Another technically possible candidate is recorded in older sources: Kx. *o=kxwi*, Kg. *o=kxwi* ~ *o=kxwì*, Gr. *o=kxwí*. It is a transparent compound from PJ **o* ‘to do, make’ + PJ **kxúí*, and both for Ju. and Ek. it is translated as ‘speak, talk (about smth.)’ rather than ‘say (smth. specific)’. Furthermore, Dickens even assigns the morpheme *kxúí* a pronominal rather than verbal meaning: ‘be thus, be so (e. g. of the sound, sight or way of doing something)’, although a more detailed analysis of contexts is needed to clarify the situation.
- ǀHoan: **kǀĩ** (C, G).
- Ju-ǀHoan: PJ **kò* and ǀHoan *kǀĩ* constitute formal consonantal class matches, but root vowel correspondences are highly irregular. Despite this, we may count the pair as a «weak» etymological match, due to the semi-auxiliary nature of the word and, consequently, the possibility of undetected suffixes or enclitics to influence its vocalism in either of the two compared taxa.

72. SEE (+)

- PJ: ***séŋ** ~ ***héŋ** (Kx. *se*: ~ *se:*, Kg. *s:ŋ*, Gr. *sŋ*, OK. *siŋ* ~ *síŋ* ~ *süŋ* ~ *hŋ*, Ek. *híŋ* ~ *hń* ~ *šŋ*). ◇ For Ju. proper, Dickens translates the cognate form *sé* as ‘to look (at), look after, investigate’, while reserving the meaning ‘to see’ for Ju. *hò* ← PJ **hò(ò)* ‘to find’ (cf. Ek. *hò-hò* id.). Phonological reconstruction is problematic. Ju. and Kx. drop the nasal part of the coda in this root just as they do for the verb ‘to drink’ q.v., for not quite clear reasons; nevertheless, most of the dialects, including additional data from Snyman's general survey, confirm original **-ŋ*. Vocalism is tentatively reconstructed as **-e-* based on Ju. data (in most dialects the two codas, *-iŋ* and *-eŋ*, seem to have merged). Initial **s-* is occasionally found lenited to *h-*; this either means a unique positional development before a syllabic nasal, or reflects an original aspirated **sʰ-* (not enough data to reach a definite conclusion).
- ǀHoan: **cí** (C, G).
- Ju-ǀHoan: A solid lexicostatistical and etymological match; correspondences are regular (for PJ **s* : ǀHoan **c*, see ‘hear’; deletion of velar nasal coda in ǀHoan is all-pervasive, see corr. #16).

73. SEED (?)

- PJ: (?) *!ó (OK. !ó, Ek. !ó). ◇ Outside the Northern branch, this word is elicited as Ju. !ó ‘pip’, confirming PJ reconstructibility with a highly natural semantic narrowing in Ju. On the other hand, Ju. ||àʔá ‘seed, kernel, marrow’, with the former meaning more precisely expressed by the compound ||xàrà-||àʔá ‘plant seed’, corresponds to Ek. ||àʔà ‘bone marrow’, suggesting a more general/abstract semantics of ‘pith, core substance’ for the protolevel. In older sources, the meaning is attested quite poorly.
- †Hoan: (?) !uru: (T). ◇ Attested only in Traill 1973. Unreliable.
- Ju-†Hoan: It is preferable to exclude this word from comparison, since PJ reconstruction is not particularly secure, and neither is the †Hoan entry. The Swadesh meaning ‘seed’ (as a general term) is quite unstable in Ju-Taa languages on the whole.

74. SIT (+)

- PJ: *ʔǃ́ǃ́ (Ju. ǃ́ǃ́, Kx. ǃ́ ~ ǃ́, Kg. ǃ́ ~ ǃ́ ~ ǃ́ǃ́-a, Gr. ǃ́ǃ́, OK. ǃ́ ~ ǃ́, Ek. ǃ́ǃ́). ◇ Preserved in all daughter dialects. Northern forms indicate an original preglottalized nasal click (cf. also the variants ǃ́ǃ́ /Western/, ǃ́ǃ́ /Eastern/ in Heikkinen 1986: 23). Coda is probably the same as in ‘blood’ q.v. Singular action form; the corresponding plural stem is PJ *ǃ́ǃ́ (Ju. ǃ́ǃ́, Ek. ǃ́ǃ́, Kx. ǃ́ǃ́, OK. !o:, etc.).
- †Hoan: ǃ́ǃ́ (C, G). ◇ Suppletive plural action form: kí=ǃ́ǃ́ (C, G).
- Ju-†Hoan: A perfect lexicostatistical match; note the corresponding preglottalized nasal clicks. The plural action stems, however, do not correspond to each other and cannot be etymologized on a mutual basis. ◇ HH: 21, 28.

75. SKIN (-)

- PJ: *ǃ́ǃ́ (Ju. ǃ́ǃ́, Kx. ǃ́ǃ́, Kg. ǃ́ ~ ǃ́ ~ ǃ́ǃ́a ~ ǃ́ǃ́ǃ́, Gr. ǃ́ǃ́: ~ ǃ́ǃ́ǃ́, OK. ǃ́ǃ́ ~ ǃ́ǃ́, Ek. ǃ́ǃ́). ◇ Preserved in all daughter dialects. Correspondences are regular. Some old sources seem to reflect an additional suffixal variant *ǃ́ǃ́-a (or ǃ́ǃ́-ba?) that is not confirmed in more recently transcribed material.
- †Hoan: ǃ́ǃ́ (C, G).
- Ju-†Hoan: No lexicostatistical or etymological parallels. Of note, perhaps, is the complete segmental correlation between †Hoan ǃ́ǃ́ ‘skin’ and PJ *ǃ́ǃ́ ‘house’, but since traditional San houses are made of branches and reeds rather than animal skins, the connection is highly dubious on semantic grounds.

76. SLEEP (+)

- PJ: *ǃ́ǃ́ (Ju. ǃ́ǃ́, Kx. ǃ́ǃ́ ~ ǃ́ǃ́, Kg. ǃ́ǃ́ ~ ǃ́ǃ́, Gr. ǃ́ǃ́, OK. ǃ́ǃ́ ~ ǃ́ǃ́, Ek. ǃ́ǃ́). ◇ Correspondences are regular and trivial, including the development *ǃ́ǃ́ → ǃ́ǃ́ in Ekoka.
- †Hoan: ǃ́ǃ́ (C, G). ◇ HH: 21, 23.
- Ju-†Hoan: A phonetically perfect lexicostatistical match. See corr. #18 for lack of nasalization in †Hoan.

77. SMALL (≈)

- PJ: *ǃ́ǃ́ ~ *ǃ́ǃ́-mà (Ju. ǃ́ǃ́/-mà/, Kx. ǃ́ǃ́-ma ~ ǃ́ǃ́-ma, Kg. ǃ́ǃ́-ma ~ ǃ́ǃ́-ma, Gr. ǃ́ǃ́-ma, OK. ǃ́ǃ́-ma, Ek. ǃ́ǃ́-mà). ◇ In Ju., the simple form ǃ́ǃ́ is used after nouns with diminutive suffixes (e.g. ǃ́ǃ́-ma ǃ́ǃ́ ‘small house’); the compound form ǃ́ǃ́-mà (where -mà itself is a diminutive suffix) is used more frequently. Considering the data from the rest of the dialects, this situation is reconstructible for the PJ level, i.e. the PJ root *ǃ́ǃ́ must have been most frequently used with the diminutive suffix *-mà. There is also no solid evidence for *mà

having ever functioned as an independent adjective ‘small’ on the same chronological level (some old sources list *ma* ‘small’ as a separate word, but textual examples always show it as a diminutive suffix, appended to nominal roots).

- ǀHoan: **ǁxǃũ** (C, G). ◇ Glossed as ‘narrow’ in some sources, but cf. *těma-si ǁxǃũ* ‘the dog is small’, etc. (hardly ‘narrow’). Of special note is the common diminutive suffix *-sǃ* (C, G), as well as *zǃna* (Sasi *dǃna*) ‘small /child/’ (used primarily in the submeaning ‘young’, but also seemingly attested in auxiliary functions, cf. Sasi *dana-si* ‘a little’).
- Ju-ǀHoan: No direct lexicostatistical matches. However, ǀHoan *ǁxǃũ* may be tentatively compared with Ju. *ǁuǃí*, Kg. *ǁwí* ‘thin (e.g. of paper)’, even though the click efflux correspondences are irregular; it is possible to suggest some rare type of dissimilation (e.g. **ǁxǃuǃí* → *ǁuǃí* in PJ) to get past this obstacle. Likewise, it is not excluded that PJ **cǃe* is the same morpheme as the diminutive suffix *-si* in ǀHoan, but this also requires explaining an irregular correspondence (lenition due to the shifted clitical/suffixal status of the morpheme?). At least one of these etymologizations has a good chance of being correct, so we accept the situation as reflecting a «partial» match.

78. SMOKE (≈)

- PJ: ***šórè ~ *šórà** (Ju. *šórà*, Kx. *šore ~ šori*, Kg. *šorre ~ šure*, Gr. *šorǃ*, Ek. *šúlè*). ◇ Preserved in most daughter dialects; only for OK. Bleek lists the form *ǃnu*, of unclear origin (the original root is still preserved as *čule ~ čuli* ‘tobacco, snuff’). Correspondences are largely trivial, except for the unclear vocalic variation in the second syllable (cf. also Ju. *šòrò* ‘tobacco’, with yet another variant).
- ǀHoan: **zǃóe^ǃ** (H&H) ← ***dǃóe^ǃ**.
- Ju-ǀHoan: The ǀHoan form corresponds precisely to Ju. *dǃǃǃ* ‘to smoke out (bees), to make someone inhale smoke for medicinal purposes, etc.’. Since the overall semantics of the Ju. word may be generalized as ‘to make use of smoke’, zero-derivation of this verb from an original noun ‘smoke’ seems far more likely than the opposite scenario, in which case PJ **šórǃ* should be understood as an innovation (could ‘tobacco’ actually be the original meaning here?). ◇ HH: 14, 22.

79. STAND (≈)

- PJ: ***ǃǃǃ** (Ju. *ǃǃǃ*, Kx. *ǃǃǃ*, Kg. *ǃǃ ~ ǃǃ ~ ǃǃǃ-a*, OK. *ǃǃa ~ ǃǃa*, Ek. *ǃǃ ~ ǃǃ*). ◇ Preserved in all daughter dialects. The Ek. form is listed as *ǃǃǃ* (Western dialect) vs. *ǃǃ* (Eastern dialect) in Heikkinen 1986: 25, conflicting with König & Heine's transcription of a simple nasalized click and impeding a precise reconstruction. Note that this is the singular subject action verb; the corresponding suppletive plural stem is PJ **ǃǃa* (Ju. *ǃǃa*, Ek. *ǃǃa*, etc.).
- ǀHoan: **ǃǃǃ** (C, G). Suppletive plural action form: *ǃǃǃ* (ibid.).
- Ju-ǀHoan: This is a rare situation where a precise etymological match may be set up for the plural action stem (PJ **ǃǃa* = ǀHoan *ǃǃǃ*), but not for the singular one: despite a certain degree of phonetic similarity, discrepancies between click effluxes and codas remain unexplainable (the vowel at least could be explained away as extra suffixation, but the total lack of nasality in the ǀHoan form is a grave problem that prevents common etymologization of both items). ◇ HH: 21, 27 (plural action stem).

80. STAR (+)

- PJ: ***ǃǃǃ** (Ju. *ǃǃǃ*, Kx. *ǃǃǃ*, Kg. *ǃǃ ~ ǃǃ*, Gr. *ǃǃǃ*, OK. *ǃǃ ~ ǃǃ ~ ǃǃ*, Ek. *ǃǃǃ*). ◇ Preserved in all daughter dialects.
- ǀHoan: **ǃǃ** (C, G). ◇ Recorded as *ǃǃ* for the Sasi dialect.

- PJ: **lòm* ~ **lùm* (Ju. *lòm*, Kx. *l̃um*, Kg. *l̃um* ~ *l̃om*, Gr. *l̃u:m*, OK. *l̃um*, Ek. *l̃m* ~ *l̃ùm* ~ *l̃òm*).
 ◇ Preserved in all daughter dialects. See notes on ‘mountain’ for a possible lexical distinction between it and ‘stone’.
- ‡Hoan: *l̥hòā*¹ (C, G).
- Ju-‡Hoan: The ‡Hoan form is compared by Heine and Honken with Ju. *l̥hòʔà* ‘stone used to stroke the shaft of an arrow in order to straighten it’; word-initial correspondences are not perfectly regular, but may point to a complex click efflux (**l̥h-*) with different paths of simplification in both branches. For semantics, cf. also the Ju. compound form *l̥hòʔà-l̥hàè* ‘stony veld’, indicating that ‘stone’ (neutral/generic) may have been the original meaning. PJ **lòm* ~ **lùm*, on the other hand, finds no etymological parallels in ‡Hoan.

- PJ: ***ǎm** (Ju. *ǎm*, Kx. *ǎm*, Kg. *ǎm*, Gr. *ǎm*, OK. *ǎm*). ◇ The situation with this root is somewhat complicated from an areal perspective. In Ek., *ǎm* is only attested in the meaning ‘day, hour’ (König & Heine 2008: 73), while the standard equivalent for ‘sun’ is *gàò* ~ *gàʔō*. This looks suspicious in light of the existence of Proto-Khoe ***ǎm** ‘sun’ (Vossen 1997: 492), which could theoretically be borrowed into the far younger PJ or into individual Ju dialects already post-separation. However, a more scrupulous analysis reveals that: (a) within Khoekhoe – the subgroup of Khoe that includes Nama and serves as the most common source for recent Khoe borrowings into Ju, the actual term for ‘sun’ is **sore*-; (b) the general distribution very clearly speaks in favor of Proto-Ju status of ***ǎm**, regardless of whether its further connections with Khoe are horizontal or vertical; (c) Ek. *gàò* is quite likely related to Ju. *gàʔáro*, glossed as ‘to drink too little to quench one’s thirst’ (Dickens 1994: 200), i. e. basically ‘(still) be thirsty’, implying that ‘thirst’ might be the original meaning for this root (the semantic shift ‘thirst’ → ‘sun’ is unusual, but not impossible considering the widespread polysemy ‘sun/thirst’ in the San area. It seems that there are no clinching arguments at the moment to prove that PJ ***ǎm** was borrowed from Khoe, or vice versa.
- †Hoan: **čā** (C, G). ◇ With polysemy: ‘sun/day’.
- Ju-†Hoan: No lexicostatistical or etymological parallels.

- PJ: ***dòm** ~ ***dùm** (Kg. *dum̐m*, Ek. *dʰòm*). ◇ This root, found in at least two different subgroups of Ju, is also attested in various water-related meanings, such as ‘wash’, ‘bathe’, even ‘shelter from rain’. Other dialects all show their own individual equivalents for the meaning ‘swim’, e.g. Ju. *ǰxà* (no etymology); OK. *ĩṽa* ~ *ĩṽba* (meaning given by D. Bleek as ‘to row across, swim across’). As with other San groups, the concept of ‘swimming’ is clearly not basic enough in Ju due to natural constraints.
- ‡**Hoan**: Not attested.

- PJ: **!*!xōē** (Ju. *!xúí*, Kx. *!ʰwí* ~ *ɸwi*, Kg. *ʰwé* ~ *!hwé* ~ *ʰkxwè* ~ *ʰkxwé*, OK. *ʰwé*, Ek. *ʰxōē*).
 ◇ Preserved in all daughter dialects. Click correspondences clearly indicate original retroflex articulation.

- ǀHoan: **θxūī** (C, G).
- Ju-ǀHoan: PJ and ǀHoan forms perfectly match each other in everything (even tone!) except for the most important segment — the regular correspondence for ǀHoan *θ-* in Ju is */-* rather than *!-*. Strictly speaking, this should invalidate the comparison (it is not found, for instance, in Heine & Honken's list of comparanda), but since the discrepancy concerns a rare type of click phonation that is absent in Ju languages altogether, it is not 100% certain that PJ **/-* : ǀHoan *θ-* exhausts all possible types of correspondences before a complete list of parallels, based on a representative ǀHoan dictionary, is presented. For now, it cannot be ruled out that ǀHoan *θ-* is an innovation rather than an archaism (for instance, caused by labialization of the click efflux in certain contexts before labial vowels), which means that, in theory, *θ-* could correspond to more than one click type in Ju. Taking this into consideration, we may define this pairing as a potential match¹⁹.

85. THAT (+)

- PJ: ***toʔa** ~ ***ndoʔa** (Ju. *tòʔa*, Kg. *doá*, OK. *doa*, Ek. *ndùʔa* ~ *ndòʔa* ~ *tùʔa* ~ *tòʔa*). ◇ Since word-initial nasal clusters are generally prohibited in Ju, the variation *t-* ~ *d-* ~ *nd-* must probably result from morphemic contraction: it is reasonable to assume that **to-* represents the original root, while *ndo-* ~ *do-* are variants with an additional preposed deictic morpheme (← **NV-to-* ~ **VN-to?*). Final *-a* is a general relative morpheme.
- ǀHoan: **ǀǃǃa** (C, G). ◇ The more archaic variant *tǃa* is preserved in the Sasi dialect (Collins & Gruber 2014: 40).
- Ju-ǀHoan: A perfect lexicostatistical match. ǀHoan shows no signs of voicing or nasality as seen in Ju dialects, indirectly confirming that these variants are secondary.

86. THIS (±)

- PJ: (A) ***e** (Ju. *=è*, Kg. *e* ~ *é:ya*, Ek. *ē*); (B) ***ŋ** (OK. *ŋ*, Ek. *ŋŋ*). ◇ Ekoka is the only Ju dialect in which both of these simple morphemes are attested: according to König & Heine, *ŋŋ* “refers to objects close to the speaker or deictic centre” as well as *ē*, but *ē* “has a contrastive function (‘this, rather than any other one’)” (König & Heine 2001: 64–65). Even if this opposition is not confirmed beyond the Northern cluster, both pronominal forms look sufficiently archaic to suggest that it may have been inherited from PJ, with South-Central dialects simplifying it in favor of **e* (at least in Ju.: the situation with the other dialects remains insufficiently well described).
- ǀHoan: **hā** (C, G).
- Ju-ǀHoan: Despite some phonetic similarity (mostly in terms of root structure), it is not easy to trace PJ **e* and ǀHoan *hā* back to a single protoform. However, the vocalic correspondence is not unique (corr. #6), and ǀHoan *h-* may theoretically be equated with the Ju class prefix *h=* that typically precedes the pronominal morpheme (*h=è* ‘this’ for classes 1–4, opposed to *k=è* ‘this’ for class 5).

¹⁹ In a recent presentation, Sands (2018) mentions this parallel together with an additional possible example (Ju *ǀǃǃ* ‘burp’ : ǀHoan *ǀǃu* ‘heartburn’) as possible evidence for a special series of labio-velar clicks in Proto-Ju-ǀHoan. This actually echoes an earlier idea suggested in Starostin 2008: 358 («...some old influencing factor, for instance, a particular type of labial articulation after the click (either the click itself or the following vowel could be strongly labialized)»). However, due to the relative scarceness of evidence and lack of local typological support for separate labiovelarized clicks the suggestion remains somewhat speculative for now.

87. THOU (-)

- PJ: ***a** (Ju. à, Kx. *a-hi*, Kg. *a ~ á*, Gr. à, OK. *a ~ a-hi*, Ek. à). ◇ Preserved in all dialects, being encountered either as a simple monophonemic variant or in the emphatic variant **a-hŋ ~ *a-hi*. Curiously, in a few dialects an additional variant with an extra labial phoneme is attested: (a) for Kg., Bleek lists a special subject form *m?a*, distinguishing it from the more common object and possessive form *a*; (b) for Ek., König & Heine list a special subject form *bà*, especially in sentence-internal position. These phenomena most likely have a common origin, but the exact provenance of this labial prefix and its shape in PJ remain to be clarified.
- †Hoan: **ù** (C, G). ◇ In the Sasi dialect, there is also an additional “in-focus” form *bù ~ bù:* (Collins & Gruber 2014: 77).
- Ju-†Hoan: Unlike the 1st p. sg. pronoun, forms for the 2nd p. sg. pronoun in Ju and †Hoan cannot be reconciled with each other. The situation could make sense from a more comprehensive perspective that also includes !Ui-Taa (South Khoisan) languages as part of the same family: considering that the system there is reconstructible as **a* ‘thou’ (sg.) vs. **u* ‘you’ (pl.), it is likely that Ju has preserved the original singular form, whereas †Hoan may have replaced it with the original plural. However, this solution formally lies beyond the scope of this binary analysis. It is also curious to note the similarity of the *b-* “in-focus” Sasi prefix to the *m- ~ b-* subject prefix in certain Ju dialects, even if the prefixes in question are joined to different root morphemes.

88. TONGUE (±)

- PJ: ***Thari** (Ju. *dhàrì*, Kx. *tari*, Kg. *térri*, Gr. *nthálì*, OK. *tali*, Ek. *dhàlì*). ◇ Preserved in all daughter dialects. Correspondences between the initial consonant show irregular fluctuation of laryngeal features, including even a completely unexpected and very rare case of prenasalization in Gr., as recorded by Doke. This is consistent with the typologically aberrant (both for Africa and other world areas) phonetic behavior of the word ‘tongue’, reflecting an odd phonosemantic phenomenon that is difficult to explain in historical terms.
- †Hoan: **cèlā** (C, G), **cìrà:** (SH). ◇ Recorded as *càla* in the Sasi dialect.
- Ju-†Hoan: Judgement on whether PJ **Thari* and †Hoan *cèlā* are cognate or not has to be postponed. On one hand, the correspondences are notably irregular, since †Hoan *c-* (rather than *ç- ← *t-*) is always found in roots where PJ has affricates or sibilants (see ‘hear’, ‘see’ on this list); vocalic patterns do not present a clear match, either. On the other hand, since the word-initial consonant or cluster in PJ remains altogether unclear, and since the word ‘tongue’ tends to behave irregularly in Khoisan languages on the whole, unique historical developments in this case seem highly likely; probability of cognacy is weak, but should not be ruled out.

89. TOOTH (+)

- PJ: ***cʰau** (Ju. *cʰàù*, Kx. *crou ~ cou ~ cau*, Kg. *c:au ~ caù*, Gr. *cʰáú:*, OK. *cau*, Ek. *čʰāō*). ◇ Preserved in all daughter dialects.
- †Hoan: **cʰíú** (C, G), **cʰíù** (SH). ◇ Plural form: *cʰěō* (G), *cʰàō-qà* (SH). Recorded as *cʰáu* in the Sasi dialect.
- Ju-†Hoan: A perfect lexicostatistical match with trivial correspondences. ◇ HH: 17, 23.

90. TREE (-)

- PJ: ***ʰàŋi** (Ju. *!àṽṽ*, Kx. *lāi*, Kg. *!án ~ !án-a ~ !āũ ~ !an*, Gr. *lāŋ*, OK. *lāú ~ lā ~ gāú*, Ek. *!àhŋ ~ !hāŋ*). ◇ Preserved in all daughter dialects. However, phonetic correspondences here

are complex and, in some aspects, unique. The basic structure of the word is more or less the same as in ‘neck’ q.v., which is reflected in the reconstruction of the coda **-aŋi* for both items. Seemingly random fluctuations are, however, observed in click efflux articulation (ranging from simple velar release to prevoicing to aspiration), additional vowel properties (breathy articulation in Ju.) and in the tonal scheme. The provisional reconstruction with **^h-* and ultra-low tone on the first mora merely reflects the fact that some particularly complex bag of features must have been present on the proto-level in order to yield such a large variety of reflexes.

- ǀHoan: ǀǃ (C, G). ◇ Recorded as ǀǃ in the Sasi dialect.
- Ju-ǀHoan: It is worth noting that ǀHoan ǀǃ (Sasi ǀǃ) is a perfect phonetic match for Ju. ǀǃ ‘hunting bow’; semantically, such a link is possible, since traditional Bushman bows were «as a rule prepared from the wood of the *Grewia flava*» (Schapera 1930: 128), but requires setting up a chain of semantic shifts that is hard to accept without additional evidence. Ju **^haŋi* finds no cognates in ǀHoan.

91. TWO (-)

- PJ: **cā* ~ **cā̃* ~ **cā̃^f* (Ju. *cā̃* ~ *cā̃^f*, Kx. *ca* ~ *ča*, Kg. *sā̃* ~ *sā̃^f* ~ *s:a* ~ *ca* ~ *cā̃* ~ *ca:^f* ~ *zā̃^f*, Gr. *sā̃*, OK. *cā̃* ~ *ca* ~ *ča*, Ek. *čā̃*). ◇ Fluctuation between different types of vocalic features remains unexplained (different variants are sometimes attested within the same well-described dialect, e.g. Ju.).
- ǀHoan: ǀǃǃ (C, G).
- Ju-ǀHoan: Unless the PJ entry can be shown to represent a rare case of click affricativization (**ǀā̃^f* → **cā̃^f*), which is not altogether excluded but requires far more confirming evidence, PJ and ǀHoan forms have to be kept apart from each other.

92. WALK (GO) (±)

- PJ: **ú* (Ju. *ú*, Kx. *ú*, Kg. *ù* ~ *ù:*, Gr. *iú* ~ *?ú:*, OK. *ú*, Ek. *ú*). ◇ Preserved in all daughter dialects.
- ǀHoan: ǃǃǃ (C, G). ◇ Attested as *tào^f* in the Sasi dialect.
- Ju-ǀHoan: The ǀHoan verb **tào^f* may be tentatively analyzed as a fused formation from an early root **ta* (which is still in use as an auxiliary pre-verb, indicating motion with the purpose of completing an action) and an unspecified second component — which, incidentally, could be fairly well associated with PJ **ú* ‘to go’ (vocalic correspondences would be perfect except for unexplained pharyngealization). However, there are no definitive grounds for such a segmentation, and given the short monovocalic nature of the compared root, we can only accept this match as highly tentative (in any case, even if the suggested fusion were correct, it would constitute a near-complete lexical replacement in ǀHoan).

93. WARM (HOT) (-)

- PJ: **khúí* (Ju. *khúí*, Kx. *kwí* ~ *khwí*, Kg. *kwí* ~ *kwi* ~ *kwiya*, OK. *khwí*, Ek. *khúí*). ◇ Preserved in all daughter dialects. In all well documented sources the meaning is explicitly noted as ‘hot’ (antonymous to **ǀǃǃǃ* ‘cold’), and in PJ it seems to have been well distinguished from **ǀǃǃ* ‘warm’ (Ju., Ek. *ǀǃǃ*, etc.).
- ǀHoan: *kǃru* (C, G). ◇ Always glossed as ‘hot’; the word is probably distinct from ‘warm’, for which cf. *ǀo:* ~ *ǀuo* ‘warm’ in Traill 1973: 32, possibly = *ǀqo* ‘warmth’ (C).
- Ju-ǀHoan: The words for ‘hot’ in PJ and ǀHoan, despite some phonetic similarity, are probably not related (initial consonants do not perfectly correspond to each other, and

fossilized morphology has to be assumed for both groups to justify the connection). The words for ‘warm’, on the other hand, are most likely cognates, but better data are needed for ꞤHoan to ascertain the semantics.

94. WATER (+)

- PJ: ***ǀú** (Ju. *ǀú*, Kx. *ǀú* ~ *ǀu* ~ *ǀú*, Kg. *ǀù* ~ *ǀú*, Gr. *ǀǔ*, OK. *ǀú* ~ *ǀó*, Ek. *ǀú*). ◇ Preserved in all daughter dialects. Retroflex click articulation is seen in the Grootfontein dialect and is unambiguously reconstructible for the proto-level.
- ꞤHoan: **ǀǃ** (C, G).
- Ju-ꞤHoan: The correspondence between a retroflex click in PJ and an affricate in ꞤHoan (in this case, both phonemes even share the same characteristics of +voiced) is essentially the same as in the word for ‘hand’ (see above). Although the phonological and phonetic implications of this correspondence remain unclear, observing it specifically in two highly stable elements of the Swadesh wordlist makes coincidence highly unlikely. We count this as a direct lexicostatistical match.

95. WE (±)

- PJ: [exclusive] ***è** (Ju. *è*, Kx. *e*, Kg. *e*, OK. *e* ~ *e-hŋ*, Ek. *è*); [inclusive] ***m̐** (Ju. *m̐*, Kg. *hm*, Ek. *m̐-hm̐*). ◇ The basic opposition between exclusive and inclusive forms of the 1st p. pl. pronoun is observed in the majority of Ju dialects. For Ekoka, it is noted that *è* is now perceived as an archaic form, with speakers generally preferring the innovation *ǃù* (= ‘people’, see ‘person’ above). Both pronouns also have expanded (emphatic?) variants, well attested in Ju. (*è-!á*, *m̐-!á*) and several other dialects. Special dual forms are more rare and transparently recent (Ju. *è-cá*, *m̐-cá* ‘the two of us’, compounded with ‘two’ q.v.).
- ꞤHoan: [exclusive] **n-!āǃē** (C, G); [inclusive] **qǃā** (C, G). ◇ The variant of the inclusive pronoun in the Sasi dialect is slightly shorter: *qǃ* (Collins & Gruber 2014: 77).
- Ju-ꞤHoan: There are no clear-cut isomorphisms between the 1st p. pl. sub-systems in PJ and ꞤHoan. Surprisingly, the closest morphemes are the suffixal extensions — PJ **-!a* and ꞤHoan *-!āǃē*, which cannot be easily traced back to any recent grammaticalization patterns (but are probably further related to the productive diminutive plural ending *-!āǃā* in ꞤHoan). It is likewise reasonable to suggest a link between ꞤHoan *qǃā* and the regular plural ending *-qǃ* in the same language, but the exact nature of it is a matter of guesswork (one possible scenario, for instance, is that the original pronominal root was contracted/deleted before the ending, i.e. **n-qa* → *qa*).

It is also worth noting that a special dual variant of the pronoun is attested in ꞤHoan, where the nasal monophonemic root is represented by a labial allophone: *m-θōā* ‘us two’ (Collins & Gruber 2014: 71). This can be easily ascribed to assimilative influence of the following labial click (← **n-θōā*); on the other hand, the opposite scenario cannot be excluded, either, i.e. delabialization in front of a tightly adjacent non-labial click: **m-!āǃē* → **n-!āǃē*. Due to the uniqueness of this phonotactic environment, no examples are available to confirm or disprove such a development, meaning that it is possible to set up a tentative weak match between the exclusive pronoun in ꞤHoan and the inclusive pronoun in Ju (the disagreement in clusivity should not be a problem, since ꞤHoan must have remodeled the old opposition anyway).

96. WHAT (+)

- PJ: ***hǃ-ǃí** (Ju. *hǃ-ǃé*) / (?) ***m-** (Ek. *m̐-*). ◇ Interrogatives in Ju are usually complex, consisting of a general interrogative marker, a nominal root, and (optionally) a final particle:

thus, Ju. *hǎ-čé* = *ha* (question marker) + *či* ‘thing’ + *-e* (final particle). There is significant variation between dialects concerning the selection of the components: thus, Ek. and some other Northern dialects show *m* instead of *ha*, cf. OK. *m-pai* (D. Bleek’s data, second component is unique and unclear); Ek. *m-čá* ~ *m-čē* ~ *m-čí*. Data from J. Snyman’s comparative survey of Ju subdialects, although restricted to ‘who?’ rather than ‘what?’, show that variants of interrogative pronouns with initial *ha-* have a much wider distribution than variants with *m-*, the latter being largely restricted to the area between the Cuito and Cuando rivers. It may be suspected that *m*-initial forms are secondary in the Northern dialects, having penetrated them under the influence of Khoe, where **mā* ~ **ma* ‘who?, which?’ is one of the main interrogative stems (Vossen 1997: 379). However, this evidence is inconclusive; it is likewise possible that **m-* is archaic, surviving on the Northern and Northwestern periphery of the Ju cluster.

- ǀHoan: *ǀǎʔrī-yà* (C, G). ◇ Apparently, ǀHoan has chosen the rare strategy of neutralizing the lexical opposition between ‘who?’ and ‘what?’ in favor of ‘who?’ (see notes on ‘who?’ below). The morpheme *yà* is a general question particle. Cf. also *çini* ‘what?’ in Traill 1973: 32, not confirmed in any of the later sources. The Sasi equivalent for ‘what?’ is *ndā*, “a question word which does not exist in ǀHoan” (Collins & Gruber 2014: 192).
- Ju-ǀHoan: Any comparisons between Ju and ǀHoan interrogatives may be made only on the level of the general interrogative particle. Etymological identity of PJ **hà* and ǀHoan *yà* seems quite likely in light of the completely identical correspondence between PJ **ha* ‘3rd p. sg.’ and ǀHoan *ya* id. (although the deictic/personal and interrogative morphemes themselves are probably just homonyms). The nominal extensions of the pronouns are different, due to the lexical renewals of the words for ‘thing’ and ‘person’ in one or both subgroups after the split. Nevertheless, since the main interrogative meaning is carried by the *ha/ya* morpheme, we count both ‘what?’ and ‘who?’ as lexicostatistical matches between PJ and ǀHoan.

97. WHITE (≈)

- PJ: **!ǎʔū* (Ju. *!ǎʔú*, Kx. *!áú*, Kg. *!áo* ~ *!káo* ~ *!kxáo*, Gr. *ǀǎʔū*, OK. *!áú*, Ek. *!ǎʔū*). ◇ The structure of the stem, including a glottal stop between the two vowels, is very well confirmed by most modern sources (Ju., Ek.) as well as Doke’s Grootfontein data. It also explains the variation observed between the forms recorded for Kg., where the glottal stop may have been incorrectly interpreted as part of the click efflux. The item is well attested in the majority of dialects and safely reconstructible for the PJ level.
- ǀHoan: *ǀǎʔnna* (H&H). ◇ Listed as *ǀxaʔna* ~ *ǀaʔana* in Traill 1973: 32.
- Ju-ǀHoan: No lexicostatistical matches. PJ **!ǎʔū* ‘white’ is most likely somehow linked to Proto-Khoe **!ǎʔú* ‘white’ (Vossen 1997: 506), well represented in Kalahari Khoe and also preserved in Nama with an additional suffix (*!u-ri*). Borrowing from Proto-Khoe into PJ does not seem likely, since it is unclear why an original **!ǎʔú* should have yielded a more complicated vocalic structure in PJ; more probable is the reverse situation (PJ **!ǎʔū* → Proto-Khoe **!ǎʔú* with simplification of an unusual structure), or even the scenario according to which both forms are retained from a common ancestor of PJ and Proto-Khoe (in which case, of course, the PJ equivalent should automatically be projected onto the Proto-Ju-ǀHoan stage as well).

As for ǀHoan *ǀǎʔnna*, this is a rare case of a **CVna* structure for a ǀHoan adjective; provided that *-na* is historically of suffixal origin, a possible parallel may be seen in Ju. *ǀǎʔàbè* ‘shiny’, further relatable to *!Xóõ* (Taa) *ǀǎʔba* id. Our understanding of the productivity aspects of early Peripheral Khoisan derivational morphology is insufficient to

assess the plausibility of two different derivational suffixes for the same root, but since there is ample evidence to back up the very presence of such derivational patterns at those stages, the etymological match between **ʔaʔ-na* and **ʔaʔ-be* is acceptable. (Note that it does not necessarily invalidate the comparison of the Ju word with †Hoan ‘moon’, discussed above, since both forms can ultimately go back to the same root with different suffixes).

98. WHO (+)

- PJ: **hà-ʒù* (Ju. *hà-žòè*, Kg. *a-ž(u)* / (?) **m-* (Ek. *m-žē ~ m-žōē*). ◇ In all Ju dialects, the animate interrogative pronoun is formed from the general interrogative morpheme + **ʒù* ‘person’ q.v. (sometimes also further extended with the deictic stem **-e*: **hà-ʒù-e* → Ju. *ha-žoe*). For discussion of the interrogative morpheme, see ‘what’ above.
- †Hoan: *ʔǎri-yà* (C, G). ◇ In the Sasi dialect, the phonetic shape is *ʔǎli-yà*. A compound form, consisting of *ʔǎri* ‘man’ q.v. and the general interrogative particle *yà*. See ‘what?’ for further notes.
- Ju-†Hoan: A lexicostatistical match on the level of the general interrogative particle. See ‘what?’ for a more detailed commentary.

99. WOMAN (≈)

- PJ: **ʒʰau* (Ju. *ʒʰàú*, Kx. *ʒau ~ ʒou ~ ʒóú*, Kg. *ʒau ~ záú ~ sáú*, Gr. *zsháú*, OK. *cau ~ cáú*, Ek. *žʰāō*). ◇ Preserved in all daughter dialects. Correspondences are generally regular and trivial; PJ **ʒʰ-* automatically becomes preglottalized in Ju., so there is no need to carry it over onto the proto-level as a phonological feature. In most modern dialects the word unambiguously denotes a female human being, and should be distinguished as such from PJ **de ~ *di* ‘female (in general, incl. animals etc.)’.
- †Hoan: *ʔǎri=ǎi* (C, G). ◇ A compound form; the first part is *ʔǎri* ‘man’ q.v., while the second part, when in independent usage, means ‘female’ (listed as *ǎai ~ ǎi* in Traill 1973: 32). Suppletive plural form: *qʰà* ‘women’ (Collins & Gruber 2014: 21). Distinct from *ʒiu* ‘wife’ (Collins & Gruber 2014: 92).
- Ju-†Hoan: PJ **ʒʰau* ‘woman’ is a perfect etymological match for †Hoan *ʒiu* ‘wife’ (HH: 17), and it is safe to assume that this term may have been polysemous in the ancestral language (‘woman /in general/’ = ‘married woman’). Another transparent cognate from the same semantic field is PJ **de ~ *di* ‘female’ = †Hoan *ʒe* ‘mother’ (HH: 16). Nevertheless, †Hoan seems to have undergone lexical replacement, substituting the original term for ‘woman’ for a compound expression in which the ‘feminine’ part of the meaning is now denoted by the morpheme *ǎi*, very likely diffused in †Hoan under Taa influence, cf. !Xóõ *ǎi* ‘female’, also N|u|len *tu ǎi* ‘woman’, lit. ‘person-female’, i. e. the same model of compounding as in †Hoan. Therefore, we cannot qualify this situation as a lexicostatistical match.

100. YELLOW (-)

- PJ: **lǎŋu* (Kx. *lǎũ*, Kg. *lǎŋ ~ lǎŋ*, Gr. *lǎŋ ~ lǎŋ*, OK. *lǎŋ*). ◇ Same word as ‘green’ q.v.; most of the old sources on Ju dialects indicate no lexical distinction between the basic ‘green’, ‘blue’, and ‘yellow’. In more modern and more detailed sources, we occasionally encounter separate entries for ‘yellow’, e.g. Ju *lǎŋi-lǎú*, lit. ‘/the color of/ the jewel beetle’s (*lǎŋi*) belly (*lǎú*)’, and Ek. *lǎũ* = ‘egg’ q.v. Naturally, these have to be interpreted as recent (completely transparent) semantic innovations.

- ǀHoan: **zaʔa** (T). ◇ Same word as ‘green’; attested only in Traill 1973, thus not highly reliable from the phonetic or semantic aspect.
- Ju-ǀHoan: No lexicostatistical or etymological matches.

101. FAR (-)

- PJ: ***ǀxǎ** (Ju. *ǀxǎ*, Kx. *ǀxǎ*: ~ *ǀa* ~ *ǀa*: ~ *ǀǎ*: ~ *ǀǎ*: ~ *ǀxǎ*: ~ *ǀǎ*, Kg. *ǀxǎ* ~ *ǀxǎ* ~ *ǀa*, OK. *ǀxa* ~ *ǀxa*, Ek. *ǀxǎ*). ◇ The reconstruction is based on precise correspondences between Ju. and Ek. Old sources show a lot of fluctuation between the palatal and the dental (more rarely, the alveolar) click; this is not well understood (palatal clicks are frequently transcribed erroneously by L. Lloyd, D. Bleek and others, but the fluctuations look rather extreme in this particular case).
- ǀHoan: **ǀǎa** (C, G).
- Ju-ǀHoan: No lexicostatistical or etymological matches.

102. HEAVY (-)

- PJ: ***ǀĩ^h** (Ju. *ǀĩ^h*, Kx. *ti*, Kg. *tí* ~ *tí*, Ek. *ǀĩhì*). ◇ Preserved in all daughter dialects (where attested). Reconstructible for PJ with breathy vowel articulation and ultra-low tone.
- ǀHoan: **ǀqô** (C, G).
- Ju-ǀHoan: No lexicostatistical or etymological matches.

103. NEAR (+)

- PJ: ***toʔm** (Ju. *tòʔm*, Kx. *tóm* ~ *toma* ~ *tum* ~ *dom*, Kg. *t:umm* ~ *tumma* ~ *tamma*, OK. *tum*, Ek. *tòʔm*). ◇ Preserved in all daughter dialects. Some of the attested forms represent the complex «junctive» variant **toʔm-a* (supposedly followed by a complement).
- ǀHoan: **ǀǎǎm** (C, G). ◇ Should go back to an earlier **taʔm*.
- Ju-ǀHoan: Consonantal correspondences between PJ and ǀHoan are perfect; vocalism remains more complicated, but cf. HH: 18, where several additional examples of the same pattern (PJ **o* : ǀHoan *a*) are adduced. The authors provisionally interpret them as reflecting Ju-ǀHoan **ao*, without mentioning that all such instances occur exclusively before the labial nasal coda (e. g. ǀHoan *ǀnaʔm* ‘springhare’ = PJ **ǀoʔm* id., ǀHoan *ǀám* ‘ripe, cooked’ = PJ **ǀom* id., etc.). The likeliest solution is that the coda simply influenced the original vocalism in PJ. Less clear is the correlation between glottalic articulation of the vowel in PJ vs. pharyngealization in ǀHoan, but this, too, is not unprecedented (cf. ‘cold’ above, or PJ **ǀǎǎma* ‘to enter’ — ǀHoan *ǀaʔm* id.). Overall, while the phonological and phonetic details still deserve closer scrutiny, the etymology as a whole can be evaluated as highly reliable. ◇ HH: 22.

104. SALT (?)

- PJ: ***ǀgúí** (Ju. *ǀgúí*, Kg. *ǀgwi*, OK. *ǀgwi*, Ek. *ǀgúí*). ◇ This is the most widespread and the least etymologically suspicious equivalent for ‘salt’ in Ju. Another root, attested as Kx. *dabe*, Ju. *díbí* and also recorded by Snyman for several other Ju subdialects, is most likely of Khoe origin (cf. Proto-Khoe **dobe* ‘salt’ in Vossen 1997: 481).
- ǀHoan: **ǀqǎǎnǎ** (C, G). ◇ Clearly the same word as !Xóǀ *ǀqǎǎnǎ* ‘salt’.
- Ju-ǀHoan: No lexicostatistical or etymological matches. Judging by the situation in Ju, the meaning ‘salt’ is rather easily diffused across different Khoisan lineages, so it is highly likely that ǀHoan *ǀqǎǎnǎ* is a borrowing from Taa (rather than both being inherited from Proto-Peripheral Khoisan).

105. SHORT (-)

- PJ: *!ò ~ *!ò-mà (Ju. !ò-mà, Kx. !ò:, Kg. !o-ma ~ !o:-ma, OK. !o-!o, Ek. !ò). ◇ Preserved in most dialects. The root can be used by itself or in conjunction with the diminutive suffix *-ma.
- †Hoan: †éū (C, G).
- Ju-†Hoan: †Hoan †éū is etymologically comparable with Ju. †àò^h ‘to lack, be short of’ (front vocalism in †Hoan is apparently caused by palatal influence of the click), but the Ju. form itself is not safely reconstructible for PJ. Additionally, there are still problems with phonetics (prosody) and semantics, so the etymology is not fully convincing.

106. SNAKE (≈)

- PJ: *†àgà ~ *†àwà (Ju. †àgà-mà ~ †à:-mà, Gr. †àwà, Ek. !àwà). ◇ The generic term for ‘snake’, reconstructible for PJ, has an atypical bisyllabic structure, since *-ga ~ *-wa is not one of the few common syllables allowed in coda position. Most likely, the form is originally a compound, although the phonetic and semantic properties of its source morphemes are unclear. There are several terms denoting specific types of snakes in PJ that are even more widespread and simpler in structure, e.g. *†ɿ ‘python’, *!kxāũ ‘blind snake’, *!le ‘puff-adder’; the common word for the entire suborder may be some descriptive term (of a euphemistic nature?). It is useful to note that some old sources occasionally quote words for specific types of snakes in the general meaning ‘snake’: e.g. Kx. !e: ~ !i ‘snake’ (= ‘puff-adder’), OK. !áũ ~ !wē ‘snake’ (= ‘blind snake’). Naturally, it is impossible to correctly assess the semantic scope of these forms from existing data.
- †Hoan: !ái (C, G).
- Ju-†Hoan: The †Hoan term for ‘snake’ is a near-perfect correspondence for PJ *!ai ‘puff-adder’ (see ‘claw /nail’ on the possible correspondence between PJ *! and †Hoan !), but there are no parallels in †Hoan for PJ *†àgà — another indirect hint at the non-archaic nature of this compound.

107. THIN (-)

- PJ: *žǎm (Ju. žǎm, Kx. ža’m, Kg. žám, Gr. žam). ◇ A common Ju morpheme. The Ek. equivalent is !kxài, perfectly corresponding to Ju. !kxài ‘wrinkled’ and probably semantically innovative.
- †Hoan: |xolo (C).
- Ju-†Hoan: No lexicostatistical or etymological parallels.

108. WIND (-)

- PJ: (?) *†a (Kx. †ā ~ †a:, Kg. †a ~ †ā). ◇ Although this root is quite widely distributed throughout the dialects (judging by J. Snyman's comparative data), it is oddly missing in both of the best described Ju varieties. In Ju., it has been replaced by mǎ^f, originally a verbal stem with the meaning ‘to blow /of wind/’ (cf. Ek. mǎ^f ‘to blow’, etc.). In some of the Northern dialects we see a different replacement: OK. !uli, Ek. !ðhlì ~ !ðhlì-gō, likely cognate with Ju. !ðrò ‘whirlwind’, i.e. originally ‘strong wind’. On the other hand, the similarity between this root and Proto-Khoe *†ā ‘wind’ (Vossen 1997: 507) suggests an alternate scenario — namely, areal borrowing from Khoe sources along the same lines as ‘fish’ q.v. If so, PJ *ma^f could have very well been both a verbal (‘blow’) and nominal (‘wind’) root, with narrow specialization to verbal usage after the nominal functions were taken over by the Khoe borrowing. A more insightful evaluation of the probabilities will only be possible in the context of a general study on the scope and nature of Ju-Khoe areal contacts.

- ǀHoan: **ǀqʷui** (C). ◇ Similarity with !Xóõ *ǀqʰùe* ‘wind’ is hardly accidental, but in this case, borrowing is not an immediately obvious explanation, since there are visible phonetic discrepancies (glottalized click efflux in ǀHoan vs. aspirated in !Xóõ) that should not be characteristic of recent contact.
- Ju-ǀHoan: No lexicostatistical or etymological parallels (regardless of whether the comparison is made with PJ **ǀa* or **maʰ*).

109. WORM (?)

- PJ: Not properly reconstructible due to lack of attestation. Only the Ju. word is known: *ǀũǀũ*.
- ǀHoan: *ǀõǀõ*: ~ *ǀũǀũ*: ~ *ǀǃu*: (T). ◇ Not attested in any reliable sources.
- Ju-ǀHoan: Although there is too little information for an etymological or lexicostatistical decision, it is curious that the Ju. and ǀHoan forms are extremely similar to each other. However, the correspondence between a palatal click in Ju. (or PJ) and an alveolar click in ǀHoan would be highly irregular, unless Traill's phonological transcription is in error — but no other examples of such errors could be detected upon careful analysis of the data in Traill 1973.

110. YEAR (-)

- PJ: (?) ***kuri** (Ju. *kúri*, Kx. *kuri*, OK. *kuri*). ◇ Although the form is quite widely spread across Ju dialects, its projection onto the PJ level is highly dubious — like ‘fish’ and possibly ‘wind’ (see above), this is most likely a borrowing from Khoe **kúri* ‘year’ (Vossen 1997: 454). There is, however, very limited data on alternate candidates. In Ek., the meaning ‘year’ is expressed by the same word as ‘rain’ (*ǀǃà*) — possibly an archaism, but explicitly limited to just one dialect. For the Grootfontein dialect, Doke records *ǀǃǃũ* ‘year’, an isolated form with no parallels whatsoever.
- ǀHoan: **kʰǃǃ** (C, G).
- Ju-ǀHoan: No lexicostatistical or etymological parallels.

Data analysis

The table below summarizes all our findings, once again classifying all matches into «solid» (confirmed by recurrent correspondence patterns), «dubious» (containing no more than one strong violation of observed patterns), «etymological» (potential cognates are only attested with a semantic shift), and non-existent. The 10 additional items (101–110) are marked separately (e. g. «8+1» means that there are 8 matches in the main wordlist and 1 more among the ten additional items).

Match type	List half	Cases	Wordlist items
Solid	1st	21	‘blood’, ‘die’, ‘ear’, ‘eat’, ‘eye’, ‘hand’, ‘head’, ‘hear’, ‘horn’, ‘I’, ‘kill’, ‘louse’, ‘name’, ‘new’, ‘not’, ‘one’, ‘star’, ‘tooth’, ‘water’, ‘what’, ‘who’
Solid	2nd	8 + 1	‘all’, ‘belly’, ‘earth’, ‘red’, ‘see’, ‘sit’, ‘sleep’, ‘that’, ‘near’
Dubious	1st	6	‘claw /nail/’, ‘drink’, ‘mouth’, ‘tail’, ‘tongue’, ‘we’
Dubious	2nd	5	‘bite’, ‘cold’, ‘say’, ‘this’, ‘walk /go/’
Etymological	1st	5	‘foot’, ‘meat’, ‘moon’, ‘smoke’, ‘stone’
Etymological	2nd	9 + 1	‘big’, ‘come’, ‘knee’, ‘many’, ‘person’, ‘small’, ‘stand’, ‘white’, ‘woman’, ‘snake’
No matches	1st	18	‘ashes’, ‘bird’, ‘black’, ‘bone’, ‘dog’, ‘dry’, ‘egg’, ‘fire’, ‘hair’, ‘heart’, ‘leaf’, ‘night’, ‘nose’, ‘rain’, ‘sun’, ‘thou’, ‘tree’, ‘two’

Match type	List half	Cases	Wordlist items
No matches	2nd	18 + 6	'breast', 'fat', 'feather', 'fly', 'give', 'good', 'green', 'know', 'lie', 'liver', 'long', 'man', 'mountain', 'neck', 'root', 'skin', 'warm /hot/', 'yellow', 'far', 'heavy', 'short', 'thin', 'wind', 'year'
Excluded (lack of data)		8 + 1	'bark', 'burn', 'cloud', 'full', 'round', 'sand', 'seed', 'swim', 'worm'
Excluded (borrowings)		2 + 1	'fish', 'road', 'salt'

The following conclusions may be drawn from these statistics.

1. Percentage of lexicostatistical matches between Proto-Ju and ꞤHoan on the 100-item wordlist may vary from 32% (29/90, only counting the «solid» matches) to 44% (40/90, counting «solid» and «dubious» matches together).

Since the disintegration of Proto-Ju itself, based on lexicostatistical calculations between modern dialects, is tentatively dated to about 200 AD (Starostin 2013: 321), with the average Ju dialect replacing about 10–12% by the present day, this, according to Sergei Starostin's glottochronological method, yields a highly approximate figure of about 5000–5500 years of separation between modern Ju varieties and ꞤHoan in the worst case (all «dubious» matches discarded), or of about 4000–4500 years in the best case (all «dubious» matches included). The latter is an age roughly comparable with the most common glottochronological datings for such Eurasian families as, for instance, Fenno-Ugric (without Samoyed) or Kartvelian (together with the highly divergent Svan).

2. The number of direct solid lexicostatistical matches within the first («more stable») half of the Swadesh list vastly exceeds the number of such matches within the second half (21 against 8). This is significant evidence in favor of a genetic rather than areal connection between Ju and ꞤHoan, with the imminent underlying assumption of a common linguistic ancestor.

3. Conversely, the number of «etymological» matches is higher for the «less stable» part of the wordlist (9 against 5). This is an interesting observation that seems to agree with basic logic, since «less stable» lexical items should be expected to also be more prone to semantic change, in addition to outright elimination; however, it remains to be seen whether it may be generalized, since statistical data on this type of correlation has yet to be collected for representative samples.

4. There is currently no evidence that a majority, or even a significant portion, of lexical replacements that took place between Proto-Ju-ꞤHoan and Proto-Ju or modern ꞤHoan are due to massive borrowing from other sources. We have been able to reliably identify no more than three borrowed items (of Taa or Khoe origin), and suspicions have been raised about a few more (e.g. 'sun'), but on the whole, it seems as if the general process of disintegration was largely driven by internal factors.

Finally, in light of the «Ju-Taa», or «Peripheral Khoisan», hypothesis that interprets the similarities between North Khoisan (Ju) and South Khoisan (!Ui-Taa) in terms of genetic relationship, the following observations must be made:

- on one hand, binary comparisons between Ju and !Ui-Taa that do not find any parallels in ꞤHoan should not be regarded as significantly less reliable, since ꞤHoan is an isolated language, and its percentage of irretrievably lost Proto-Ju-Taa items should predictably be higher;
- on the other hand, caution must be exercised when dealing with exclusive ꞤHoan-Taa isoglosses (such as 'salt', etc.) that do not find parallels in either !Ui or Ju languages, particularly when these isoglosses are exact or near-exact phonetic matches; most likely, such cases reflect recent contact that should not distort our general perspective of distant genetic relationship between these taxa.

Appendix: List of observed phonetic correspondences between Ju and #Hoan

The table below lists all cases of phonetic correspondences that have been observed between Proto-Ju and Eastern #Hoan on the data of basic (Swadesh) lexical items *and* additional lexical items discussed in the main body of the paper (non-Swadesh meanings are listed in italics).

It must be noted that this list does not aim at systematic completeness; thus, there are quite a few segments reconstructible for Proto-Ju (mostly in the non-click consonant domain) that find no #Hoan correlates in this table, and vice versa. Likewise, the table does not contain a special column for Proto-Ju-#Hoan reconstructed phonemes, and while in quite a few cases one-to-many correspondence types are commented upon as to the issue of possible complementary distribution of reflexes, this is not always the case — for instance, there is currently no clear understanding of the principles that govern the reflexes of such vowel qualities as nasalization, glottalization, and pharyngealization, or of the seemingly chaotic distribution of voiced and voiceless reflexes of click phonemes. Such principles may or may not be uncovered at the next stages of etymological research on Ju-#Hoan; in the meantime, what matters most is the *recurrent* nature of such correspondences, proving or at least increasing the probability of their non-accidental nature.

The following types of correlations are included in the table:

(a) phonetically identical segments between #Hoan and Proto-Ju (for such cases, especially if the involved phonemes are rare, recurrence is not necessarily required);

(b) phonetically similar segments between #Hoan and Proto-Ju, differing by no more than one distinctive and commonly unstable feature²⁰ such as +/- voice (for consonants) or +/- raised (for vowels). If the correlation is one-to-one, with no alternate correspondences for either member of the pair, recurrence is not required. If there are conflicting one-to-many correspondences, it is recommended to establish complementary distribution (cf. #1 vs. #1a vs. #1b), or to provide at least as many examples as there are for group (c) cases;

(c) «non-trivial» correspondences, such as #35b, in which the segments differ significantly from each other. To judge such cases as recurrent correspondences, we need to have no fewer than three examples of each (with precise matching semantics or meanings connected by the most trivial of semantic shifts).

For additional examples of possible correspondences and additional comments on those listed in the table below, see Starostin 2008 and Heine & Honken 2010.

Ju	#Hoan	Items	#
a	a	‘cold’, ‘come/fetch’, ‘earth’, ‘hear’, ‘red’, ‘sleep’, ‘stand’, ‘interr. morpheme’, ‘3rd p. sg.’, ‘enter’	1
	oa	‘eye’, ‘sky’ ²¹	1a
	i	‘moon/shiny’, ‘dove’, ‘refuse/dissuade’ ²²	1b
ae	ae	‘meat/cut meat’	2
	i	‘die’	2a
ai	ai	‘puff-adder/snake’	3
	i	‘be able’	3a

²⁰ Unstability of features is well demonstrable through the analysis of closely related dialectal forms attested in the Khoisan-speaking area, where fluctuations between voiced/voiceless or high/mid articulation are well known, but the laws that govern such fluctuations have not been described to general satisfaction.

²¹ Regular development after labial clicks.

²² As a result of assimilation in *CaCi ~ *CaCe type structures.

Ju	‡Hoan	Items	#
ao	eu	‘short/lack’	4
au	u	‘foot/track’, ‘ <i>duiker</i> ’	5

V ⁱ >	V ⁱ	‘stone’	21
m	m	‘I’	22

²³ Regular development after coronal affricates and fricatives.

²⁴ Possibly a regular development after labial clicks.

²⁵ Only as a result of assimilation before an additional front vowel suffix.

²⁶ Mid vowel *o* is a much more frequent ‡Hoan correspondence for PJ **u* than ‡Hoan *u*, which is why HH's interpretation of this correspondence as reflecting a typologically unusual diphthong **ou* in Proto-Ju-‡Hoan (HH: 17) is barely credible. There are a few reliable cases of ‡Hoan *u* : PJ **u* attested as well (HH: 16), but if it turns out to be impossible to prove complementary distribution, it is more likely that additional vowel qualities will have to be set up for the ancestral state, e.g. +/-ATR differentiations (these are known to be phonologically relevant at least for Khoe languages, unlike labial diphthongs such as *ou* or *uo*, virtually unknown in Khoisan languages).

²⁷ Correlations between different types of vowel phonation in PJ and ‡Hoan are clearly very complex. The complexity may be caused by different combinations of features in the protolanguage; the base timbre of the vowel they are associated with; and various types of assimilative / dissimilative interactions with click accompaniments. At present, we lack the data to conduct a more thorough investigation, and list all the possible patterns without evaluating them on behalf of the degree of their regularity.

Ju	ǀHoan	Items	#
t	*t → ɸ	‘that’, ‘near’	23
d	*d → ʒ	‘smoke’, ‘female/mother’	24
cʔ	cʔ	‘louse’, ‘sleep’, ‘tooth’	25
č	č	‘come/fetch’	26
s	c	‘hear’, ‘see’	27
ʒ	z	‘new’	28
ʒ ^h	ž	‘woman/wife’	29
kx	kx	‘earth’	30
h	y	‘interr. morpheme’, ‘3rd p. sg.’	31
		‘blood’, ‘ear’, ‘not’, ‘sit’, ‘small/thin’, ‘refuse/dissuade’, ‘steenbok’	32
	θ	‘eye’, ‘head’, ‘one’, ‘sky’, ‘duiker’	32a
!	!	‘belly’, ‘bone/spine’, ‘horn’, ‘kill’, ‘lie/sit’, ‘name’, ‘red’, ‘ripe/cooked’	33
†	†	‘big/many’, ‘cold’, ‘knee/kneel’, ‘moon/shiny’, ‘star’, ‘short/lack’, ‘be able’, ‘dove’	34
!!	!	‘nail’, ‘puff-adder/snake’, ‘foot/track’, ‘enter’	35
	⊙	‘tail’ ²⁸	35a
	š/ž	‘die’, ‘hand’, ‘water’, ‘dig’	35b
l	l	‘meat / cut meat’, ‘stand’, ‘stone’	36
C	C	‘nail’, ‘cold’, ‘die’	37
	Ḑ	‘moon/shiny’, ‘foot/track’	37a
	C ^h	‘not’, ‘dove’ ²⁹	37b
	Cxʔ	‘small/thin’	37c
Ḑ	Ḑ	‘puff-adder/snake’, ‘stand’, ‘water’	38
	C	‘belly’, ‘eye’, ‘hand’, ‘red’, ‘enter’, ‘dig’	38a
Č	Č	‘ripe/cooked’, ‘sky’	39
	C ^h	‘stone’	39a
Cʔ	Cʔ	‘bone/spine’, ‘duiker’	40
	Cqʔ	‘blood’ ³⁰	40a
C ^h	C ^h	‘big/many’, ‘horn’, ‘kill’	41
Ḑ ^h	Cq ^h	‘lie/sit’ ³¹	42
Cʔ ^h	Cʔ ^h	‘knee/kneel’	43
	Cq ^h	‘ear’, ‘steenbok’	43a
Cx	Cx	‘tail’	44
ɾČ	ɾČ	‘head’, ‘sit’, ‘be able’, ‘springhare’	45

²⁸ Very dubious, based on one example only; however, all the other segments in ‘tail’ match each other so precisely that it is tempting to suggest some sort of rare positional development (perhaps labialization of an original retroflex click before a labial vowel?).

²⁹ Cf. also #39 below. This conflicts with #41, where aspiration is supposed to be preserved in both branches of the family. However, the examples are too semantically precise to be dismissed.

³⁰ PJ does not differentiate between glottal stop and post-velar accompaniments; presumably, ǀHoan is more archaic here, whereas in PJ they generally merged without a trace (see also corr. #43a).

³¹ Dubious, not because of the distinction in voice, but rather because uvular accompaniments in ǀHoan would rather be expected to yield glottalization in PJ (see #43a). Nevertheless, Heine & Honken list several additional examples of similar cases (HH: 29), so this does look like a realistic correlation whose conditions are yet to be properly investigated.

Г. С. Старостин. Лексикостатистические исследования по койсанским языкам I: родство между языками жу и ǀхоан

Статья представляет собой первое из серии планируемых исследований по сравнительной лексикостатистике ряда языковых семей, традиционно (со времен Дж. Гринберга) причисляемых к гипотетической койсанской макросемье. В настоящей публикации проводится детальный лексикостатистический анализ данных по двум таксонам: языкам жу, или северной койсанской (пучок относительно близкородственных диалектов), и языку восточный ǀхоан, который до недавнего времени рассматривался как изолят, но сегодня все же скорее считается ближайшим родственником языков жу. На основании как поверхностного (фонетические сходства), так и этимологического (фонетические соответствия) анализа возможных когнатов между языками жу и ǀхоан число лексикостатистических сходжений между ними определяется в диапазоне от 32% до 44%, что примерно соответствует такой же глубине родства, как между финно-угорскими или картвельскими языками. Помимо этого, анализируется также дистрибуция когнатов между различными слоями базисной лексики (более/менее устойчивыми), что дает основание утверждать именно о генетическом родстве, а не об ареальных связях между обоими таксонами.

Ключевые слова: койсанские языки, жу языки, язык ǀхоан, лексикостатистика, глоттохронология, сравнительно-исторический метод.
